### Importance of this Work

• Presents a practical iterative algorithm for the Art Gallery Problem with point guards, which finds a sequence of decreasing upper bounds and increasing lower bounds for the optimal value.

Preliminary Definitions

A Practical Iterative Algorithm 000000

Experimental Results

### Importance of this Work

- Presents a practical iterative algorithm for the Art Gallery Problem with point guards, which finds a sequence of decreasing upper bounds and increasing lower bounds for the optimal value.
- As evidence of effectiveness of the proposed algorithm, presents results showing that for every one of more than 1440 benchmark polygons of various classes gathered from the literature with up to a thousand vertices, optimal solutions are attained in just a few minutes of computing time.

Preliminary Definitions

A Practical Iterative Algorithm 000000

Experimental Results

## Importance of this Work

- Presents a practical iterative algorithm for the Art Gallery Problem with point guards, which finds a sequence of decreasing upper bounds and increasing lower bounds for the optimal value.
- As evidence of effectiveness of the proposed algorithm, presents results showing that for every one of more than 1440 benchmark polygons of various classes gathered from the literature with up to a thousand vertices, optimal solutions are attained in just a few minutes of computing time.
- This work is unprecedented since, despite several decades of extensive investigation on the AGP, all previously published algorithms were unable to handle instances of that size and often failed to prove optimality for a significant fraction of the instances tested.

# Visibility Polygon

#### Definition (Visibility Polygon)

The visibility polygon of a point  $p \in P$ , denoted by Vis(p), is the set of all points in P that are visible from p.

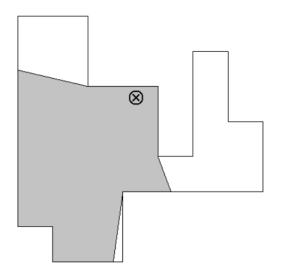

The edges of Vis(p) are called *visibility edges*, and they are said to be *proper* for *p* if and only they are not contained in any edge of *P*.

## Atomic Visibility Polygons

Preliminary Definitions

A Practical Iterative Algorithm 000000

Experimental Results

# Atomic Visibility Polygons

#### Definition (Atomic Visibility Polygons)

The geometric arrangement defined by the visibility edges of the points in S partitions P into a collection of convex polygonal faces called Atomic Visibility Polygons or simply AVPs.

Clearly, the edges of an AVP are either portions of edges of P or portions of proper visibility edges for points of S.

### Discretized Versions of AGP - AGPFC

In the Art Gallery Problem With Fixed Guard Candidates (AGPFC), one is given a finite set of points  $C \subset P$ , and the question consists of selecting the minimum number of guards in C that are sufficient to cover the entire polygon.

Preliminary Definitions

A Practical Iterative Algorithm

Experimental Results

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

#### Discretized Versions of AGP - AGPFC

In the Art Gallery Problem With Fixed Guard Candidates (AGPFC), one is given a finite set of points  $C \subset P$ , and the question consists of selecting the minimum number of guards in Cthat are sufficient to cover the entire polygon. A special case of the AGPFC is obtained when the elements of Care restricted to the vertices of P, in which case we call it the Art Gallery Problem With Vertex Guards (AGPVG).

Preliminary Definitions

A Practical Iterative Algorithm 000000

Experimental Results

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

### Discretized Versions of AGP - AGPW

In the Art Gallery Problem With Witnesses (AGPW), one is given a finite set of points  $W \subset P$ , and the problem consists in finding the minimum number of guards in P that are sufficient to cover all points in W.

Preliminary Definitions

A Practical Iterative Algorithm 000000

Experimental Results

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

#### Discretized Versions of AGP - AGPW

In the Art Gallery Problem With Witnesses (AGPW), one is given a finite set of points  $W \subset P$ , and the problem consists in finding the minimum number of guards in P that are sufficient to cover all points in W.

Clearly, coverage of W does not ensure that of P. A polygon P to be *witnessable* if there exists a finite witness set  $W \subset P$  satisfying the property that any set of guards that covers W also covers the entire polygon P.
