### Why RSA Works?

- Assume that  $m \in \mathbb{Z}_n^*$ . By Euler's theorem,  $m^{\phi(n)} \equiv 1 \pmod{n}$ .
- Now, ed ≡ 1 (mod φ(n)), that is, ed = 1 + kφ(n) for some integer k. Therefore,

$$c^d \equiv m^{ed} \equiv m^{1+k\phi(n)} \equiv m \times \left(m^{\phi(n)}\right)^k \equiv m \times 1^k \equiv m \pmod{n}.$$

RSA and ElGamal Encryption Probabilistic Encryption Diffie-Hellman Key Exchange

# Security of ElGamal Encryption

RSA and ElGamal Encryption Probabilistic Encryption Diffie-Hellman Key Exchange

## Security of ElGamal Encryption

• An eavesdropper knows g, p, y, s, t, where  $y \equiv g^d \pmod{p}$ and  $s \equiv g^{d'} \pmod{p}$ . Determining *m* from (s, t) is equivalent to computing  $g^{dd'} \pmod{p}$ , since  $t \equiv mg^{dd'} \pmod{p}$ . (Here, *m* is masked by the quantity  $g^{dd'} \pmod{p}$ .) But *d*, *d'* are unknown to the attacker. So the ability to solve the DHP lets the eavesdropper break ElGamal encryption.

### Diffie-Hellman Key Exchange

 Alice and Bob decide about a prime p and a primitive root g modulo p.

RSA and ElGamal Encryption Probabilistic Encryption Diffie-Hellman Key Exchange

(日)

- Alice and Bob decide about a prime *p* and a primitive root *g* modulo *p*.
- Alice generates a random  $a \in \{2, 3, ..., p-2\}$  and sends  $g^a \pmod{p}$  to Bob.

RSA and ElGamal Encryption Probabilistic Encryption Diffie-Hellman Key Exchange

(日)

- Alice and Bob decide about a prime *p* and a primitive root *g* modulo *p*.
- Alice generates a random *a* ∈ {2, 3, ..., *p* − 2} and sends *g<sup>a</sup>* (mod *p*) to Bob.
- Bob generates a random b ∈ {2,3,..., p − 2} and sends g<sup>b</sup> (mod p) to Alice.

RSA and ElGamal Encryption Probabilistic Encryption Diffie-Hellman Key Exchange

(日)

- Alice and Bob decide about a prime p and a primitive root g modulo p.
- Alice generates a random *a* ∈ {2, 3, ..., *p* − 2} and sends *g<sup>a</sup>* (mod *p*) to Bob.
- Bob generates a random b ∈ {2,3,..., p − 2} and sends g<sup>b</sup> (mod p) to Alice.
- Alice computes  $g^{ab} \equiv (g^b)^a \pmod{p}$ .

RSA and ElGamal Encryption Probabilistic Encryption Diffie-Hellman Key Exchange

(日)

- Alice and Bob decide about a prime p and a primitive root g modulo p.

## Diffie-Hellman Key Exchange: Security

Public-key Cryptography: Theory and Practice Abhijit Das

Diffie-Hellman Key Exchange: Security

An eavesdropper knows p, g, g<sup>a</sup>, g<sup>b</sup> and desires to compute g<sup>ab</sup> (mod p), that is, the eavesdropper has to solve the DHP.

< ロ > < 同 > < 回 > < 回 > .

## Diffie-Hellman Key Exchange: Security

- An eavesdropper knows p, g, g<sup>a</sup>, g<sup>b</sup> and desires to compute g<sup>ab</sup> (mod p), that is, the eavesdropper has to solve the DHP.
- If discrete logs can be computed in Z<sup>\*</sup><sub>p</sub>, then *a* can be computed from g<sup>a</sup> and one subsequently obtains g<sup>ab</sup> ≡ (g<sup>b</sup>)<sup>a</sup> (mod p). So algorithms for solving the DLP can be used to break DH key exchange.

< ロ > < 同 > < 回 > < 回 > .

## Diffie-Hellman Key Exchange: Security

- An eavesdropper knows p, g, g<sup>a</sup>, g<sup>b</sup> and desires to compute g<sup>ab</sup> (mod p), that is, the eavesdropper has to solve the DHP.
- If discrete logs can be computed in Z<sup>\*</sup><sub>p</sub>, then *a* can be computed from g<sup>a</sup> and one subsequently obtains g<sup>ab</sup> ≡ (g<sup>b</sup>)<sup>a</sup> (mod p). So algorithms for solving the DLP can be used to break DH key exchange.
- Breaking DH key exchange may be easier than solving DLP.

- Breaking DH key exchange may be easier than solving DLP.
- At present, no method other than computing discrete logs in Z<sup>\*</sup><sub>p</sub> is known to break DH key exchange.
- Practically, we require *p* to be of size ≥ 1024 bits. The security does not depend on the choice of *g*. However, *a* and *b* must be sufficiently randomly chosen.

#### Signature generation

Input: Message  $m \in \mathbb{Z}_p$  and signer's private key (p, g, d). Output: Signed message (m, s, t).

Generate a random session key  $d' \in \{2, 3, ..., p-2\}$ . Compute  $s \equiv g^{d'} \pmod{p}$  and  $t \equiv d'^{-1}(H(m) - dH(s)) \pmod{p-1}$ .

#### Signature verification

Input: Signed message (m, s, t) and signer's public key (p, g, y). Set  $a_1 \equiv g^{H(m)} \pmod{p}$  and  $a_2 \equiv y^{H(s)}s^t \pmod{p}$ . Output "signature verified" if and only if  $a_1 = a_2$ .

#### **ElGamal Signature (contd)**

# • Correctness: $H(m) \equiv dH(s) + td' \pmod{p-1}$ . So $a_1 \equiv g^{H(m)} \equiv (g^d)^{H(s)}(g^{d'})^t \equiv y^{H(s)}s^t \equiv a_2 \pmod{p}$ .

RSA and ElGamal Signatures DSA and ECDSA Blind and Undeniable Signatures

(日)

- Correctness:  $H(m) \equiv dH(s) + td' \pmod{p-1}$ . So  $a_1 \equiv g^{H(m)} \equiv (g^d)^{H(s)}(g^{d'})^t \equiv y^{H(s)}s^t \equiv a_2 \pmod{p}$ .
- Example:

RSA and ElGamal Signatures DSA and ECDSA Blind and Undeniable Signatures

(日)

- Correctness:  $H(m) \equiv dH(s) + td' \pmod{p-1}$ . So  $a_1 \equiv g^{H(m)} \equiv (g^d)^{H(s)}(g^{d'})^t \equiv y^{H(s)}s^t \equiv a_2 \pmod{p}$ .
- Example:
  - Take p = 104729 and g = 89. The signer chooses the private exponent d = 72135 and so y ≡ g<sup>d</sup> ≡ 98771 (mod p).

RSA and ElGamal Signatures DSA and ECDSA Blind and Undeniable Signatures

(日)

- Correctness:  $H(m) \equiv dH(s) + td' \pmod{p-1}$ . So  $a_1 \equiv g^{H(m)} \equiv (g^d)^{H(s)}(g^{d'})^t \equiv y^{H(s)}s^t \equiv a_2 \pmod{p}$ .
- Example:
  - Take p = 104729 and g = 89. The signer chooses the private exponent d = 72135 and so y ≡ g<sup>d</sup> ≡ 98771 (mod p).
  - Let m = 23456 be the message to be signed. The signer chooses the session exponent d' = 3951 and computes  $s \equiv g^{d'} \equiv 14413 \pmod{p}$  and  $t \equiv d'^{-1}(m ds) \equiv (3951)^{-1}(23456 72135 \times 14413) \equiv 17515 \pmod{p-1}$ .

RSA and ElGamal Signatures DSA and ECDSA Blind and Undeniable Signatures

### **ElGamal Signature (contd)**

- Correctness:  $H(m) \equiv dH(s) + td' \pmod{p-1}$ . So  $a_1 \equiv g^{H(m)} \equiv (g^d)^{H(s)}(g^{d'})^t \equiv y^{H(s)}s^t \equiv a_2 \pmod{p}$ .
- Example:
  - Take p = 104729 and g = 89. The signer chooses the private exponent d = 72135 and so y ≡ g<sup>d</sup> ≡ 98771 (mod p).
  - Let m = 23456 be the message to be signed. The signer chooses the session exponent d' = 3951 and computes  $s \equiv g^{d'} \equiv 14413 \pmod{p}$  and  $t \equiv d'^{-1}(m ds) \equiv (3951)^{-1}(23456 72135 \times 14413) \equiv 17515 \pmod{p-1}$ .
  - Verification involves computation of

 $a_1 \equiv g^m \equiv 29201 \pmod{p}$  and  $a_2 \equiv y^s s^t \equiv (98771)^{14413} \times (14413)^{17515} \equiv 29201 \pmod{p}$ . Since  $a_1 = a_2$ , the signature is verified.

### **ElGamal Signature (contd)**

RSA and ElGamal Signatures DSA and ECDSA Blind and Undeniable Signatures

< 日 > < 同 > < 回 > < 回 > < □ > <

#### ElGamal Signature (contd)

• Forging: A forger chooses d' = 3951 and computes  $s \equiv g^{d'} \equiv 14413 \pmod{p}$ . But computation of *t* involves *d* which is unknown to the forger. So the forger randomly selects t = 81529. Verification of this forged signature gives  $a_1 \equiv g^m \equiv 29201 \pmod{p}$  as above. But  $a_2 \equiv y^s s^t \equiv (98771)^{14413} \times (14413)^{81529} \equiv 85885 \pmod{p}$ , that is,  $a_1 \neq a_2$  and the forged signature is not verified.

RSA and ElGamal Signatures DSA and ECDSA Blind and Undeniable Signatures

・ロト ・ 厚 ト ・ ヨ ト ・ ヨ ト ・

### ElGamal Signature (contd)

Forging: A forger chooses d' = 3951 and computes s ≡ g<sup>d'</sup> ≡ 14413 (mod p). But computation of t involves d which is unknown to the forger. So the forger randomly selects t = 81529. Verification of this forged signature gives a<sub>1</sub> ≡ g<sup>m</sup> ≡ 29201 (mod p) as above. But a<sub>2</sub> ≡ y<sup>s</sup>s<sup>t</sup> ≡ (98771)<sup>14413</sup> × (14413)<sup>81529</sup> ≡ 85885 (mod p), that is, a<sub>1</sub> ≠ a<sub>2</sub> and the forged signature is not verified.
 Security:

RSA and ElGamal Signatures DSA and ECDSA Blind and Undeniable Signatures

< 日 > < 同 > < 回 > < 回 > < □ > <

- Forging: A forger chooses d' = 3951 and computes  $s \equiv g^{d'} \equiv 14413 \pmod{p}$ . But computation of *t* involves *d* which is unknown to the forger. So the forger randomly selects t = 81529. Verification of this forged signature gives  $a_1 \equiv g^m \equiv 29201 \pmod{p}$  as above. But  $a_2 \equiv y^s s^t \equiv (98771)^{14413} \times (14413)^{81529} \equiv 85885 \pmod{p}$ , that is,  $a_1 \neq a_2$  and the forged signature is not verified.
- Security:
  - Computation of *s* can be done by anybody. However, computation of *t* involves the signer's private exponent *d*. If the forger can solve the DLP modulo *p*, then *d* can be computed from the public-key *y*, and the correct signature can be generated.

RSA and ElGamal Signatures DSA and ECDSA Blind and Undeniable Signatures

- Forging: A forger chooses d' = 3951 and computes  $s \equiv g^{d'} \equiv 14413 \pmod{p}$ . But computation of *t* involves *d* which is unknown to the forger. So the forger randomly selects t = 81529. Verification of this forged signature gives  $a_1 \equiv g^m \equiv 29201 \pmod{p}$  as above. But  $a_2 \equiv y^s s^t \equiv (98771)^{14413} \times (14413)^{81529} \equiv 85885 \pmod{p}$ , that is,  $a_1 \neq a_2$  and the forged signature is not verified.
- Security:
  - Computation of *s* can be done by anybody. However, computation of *t* involves the signer's private exponent *d*. If the forger can solve the DLP modulo *p*, then *d* can be computed from the public-key *y*, and the correct signature can be generated.
  - The prime *p* should be large (of bit-size ≥ 1024) in order to preclude this attack.

(日)

• Since 
$$r \equiv c \prod_{i=1}^{t} x_i^{\epsilon_i} \pmod{n}$$
, we have  $r^2 \equiv c^2 \prod_{i=1}^{t} (x_i^2)^{\epsilon_i} \pmod{n}$ .

• But 
$$y_i \equiv (-1)^{\delta_i} (x_i^2)^{-1} \pmod{n}$$
.

• Therefore, 
$$w' \equiv r^2 \prod_{i=1}^{r} y_i^{\epsilon_i} \equiv c^2 \prod_{i=1}^{r} (-1)^{\epsilon_i \delta_i} \pmod{n}$$
, whereas  $w \equiv (-1)^{\gamma} c^2 \pmod{n}$ .

- Consequently,  $w' \equiv \pm w \pmod{n}$ .
- The check w' ≠ 0 eliminates the commitment c = 0 which succeeds always irrespective of the knowledge of the secrets x<sub>i</sub>.

Public-key Cryptography: Theory and Practice Abhijit Das

Challenge-Response Authentication Zero-Knowledge Protocols Digital Certificates

## **Digital Certificates: Contents**

- A digital certificate contains particulars about the entity whose public key is to be embedded in the certificate:
  - Name, address and other personal details of the entity.
  - The public key of the entity. The key pair may be generated by either the entity or the CA. If the CA generates the key pair, then the private key is handed over to the entity by trusted couriers.

The certificate is digitally signed by the private key of the CA.
