ISI Foundation, Italy

Language Dynamics

- Language is **complex adaptive system**
- Evolves through the process of self-organization
- Question: How can one explain the interplay of structure and dynamics of such a system?
=> **Statistical Physics tools**

A Physical System Perspective

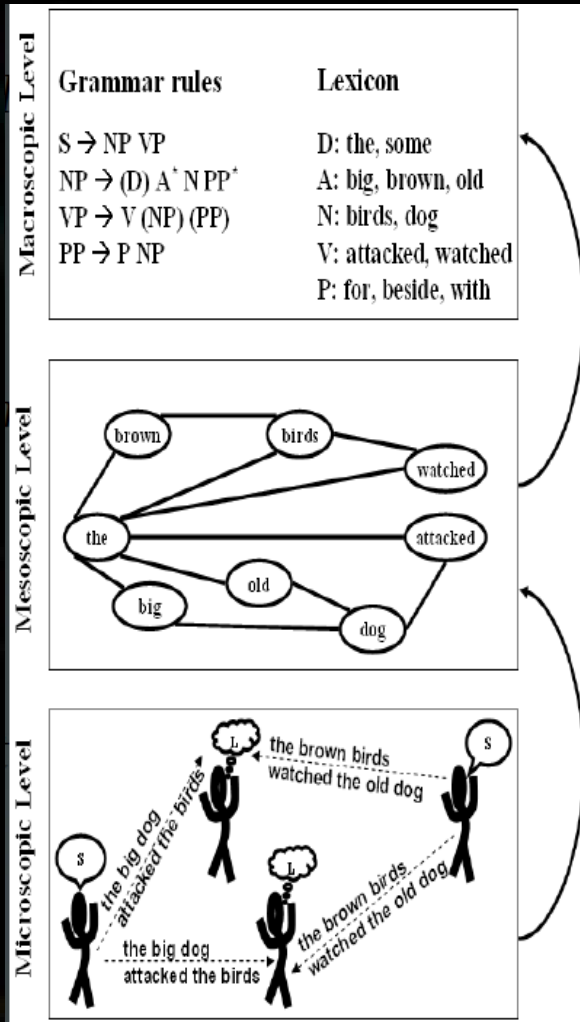

Language as a whole (grammatical constructs)

Language as a collection of interactions among linguistic units

Language as a collection of utterances

Macroscopic level

Names for meanings

SPAM !

Names for meanings

SPAM !

Spiced HAM

Monty Python's spam comedy (1970 TV show)

Mr. and Mrs. Bun enter a cheap pub

Mr. Bun: What have you got, then?

Waitress: egg and SPAM; egg, bacon, and SPAM; egg, bacon, sausage and SPAM; SPAM, bacon, sausage, and SPAM; SPAM, egg, SPAM, SPAM, bacon, and SPAM; SPAM, SPAM, SPAM, egg, and SPAM; baked beans, SPAM and SPAM....

Mrs. Bun : Have you got anything without SPAM in it?

Waitress: Well, there's SPAM, egg, sausage, and SPAM. That's not got MUCH SPAM in it.

Mrs. Bun: I don't want any SPAM!

Mr. Bun: Why can't she have egg, bacon, SPAM, and sausage?

Mrs. Bun: That's got SPAM in it!

Mr. Bun: Not as much as SPAM, egg, sausage, and SPAM.

Mrs. Bun: Look, could I have egg, bacon, SPAM, and sausage without the SPAM?

Waitress: Uuuuuuuuugggggh!

Mrs. Bun: What d'you mean uuugggh!? I don't like SPAM.

Vikings: (singing) SPAM, SPAM, SPAM, SPAM..SPAM, SPAM, SPAM, SPAM... Lovely SPAM,wonderful SPAM....

Mr. Bun

Waitress

Mrs. Bun

((e-)spam to spam)?

The Naming Game

The “Talking Heads” Experiment

Speaker

Hearer

- Perceive scene
- Choose topic
- Conceptualize
- Verbalize

interpret utterance
perceive scene
apply meaning
point to referent

Luc Steels, Autonomous Agents and Multi-agent Systems (1998)

The Grounded Naming Game

Minimal Naming Game

- In silico settings
- Interactions of N agents who communicate on how to associate a name to a given object
- Agents:
 - can keep in memory different words
 - can communicate with each other

Baronchelli et al., J. Stat. Mech. (2006)

Mean field: fully-connected network

Mean field: fully-connected network

Uttered word found → Success

Game Rules

Speaker

Hearer

Retain only the successful word

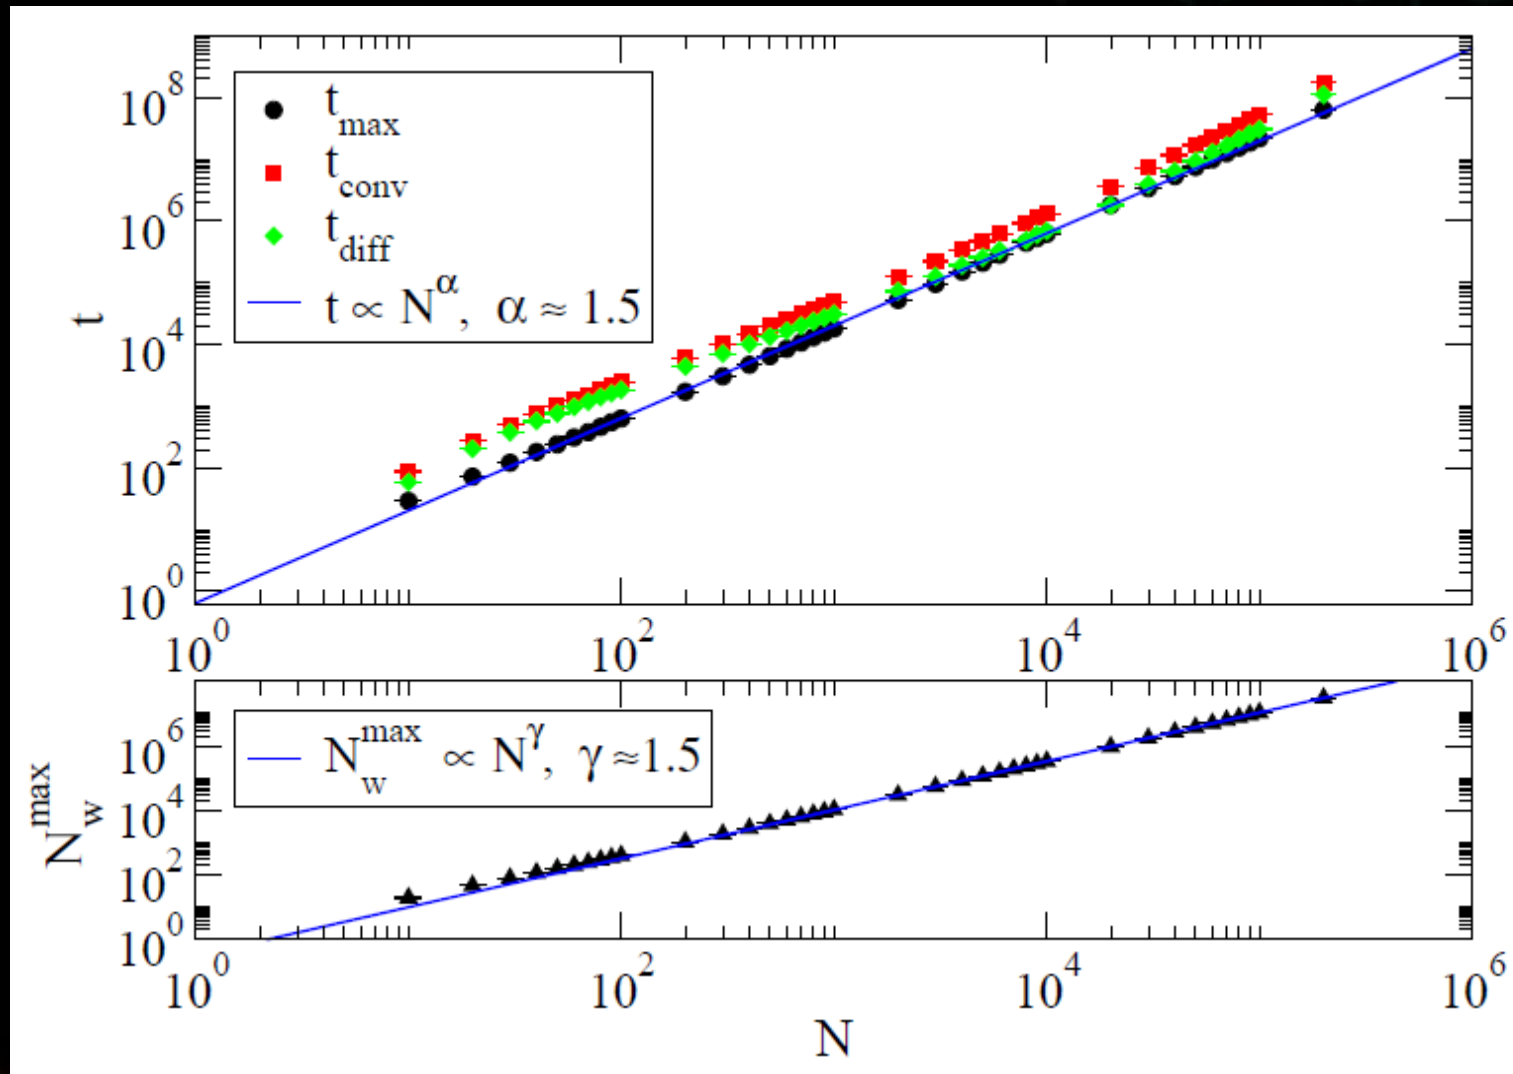

Phenomenology

- t - Game time (no. of games)
- $N_w(t)$ - total number of words in the system at time t
- $N_d(t)$ - number of different words in the system at time t
- $S(t)$ - average success rate at time t
- N_w^{max} - maximum memory required by the system
- t_{max} - the time required to reach the memory peak
- t_{conv} - the time required to reach the global consensus

Temporal evolution of observables

Scaling Relations

Baronchelli et al., J. Stat. Mech. (2006)

Scaling relations for various topologies

	N^w_{max}	t_{max}	t_{conv}
Mean-field	$N^{1.5}$	$N^{1.5}$	$N^{1.5}$
Scale-free	N	N	$N^{1.4}$
Erdos-Renyi	N	N	$N^{1.4}$
Small-world	N	N	$N^{1.4}$

What about time-varying networks?

- Social interactions and human activities are intermittent
- Links appear and disappear from the system
- As time progresses, societal structure keeps changing with social conventions, shared cultural and linguistic patterns reshaping themselves

At time t

$t \rightarrow t+1$

At time $t+1$

Opinion formation

- Opinions evolve over time
 - some get trapped into groups
 - some die competing with others
 - usually a single opinion emerges as the winner but multi-opinion state may exist

Datasets

- Face-to-face interaction (SG)
 - Science Gallery in Dublin, Ireland (2009)
 - “INFECTIOUS:STAY AWAY” initiative for 69 days
- Face-to-face interaction (HT)
 - conference attendees of the ACM Hypertext 2009
- Nodes -> visitors/participants
- Edges -> close-range face-to-face proximity existent for 20 seconds

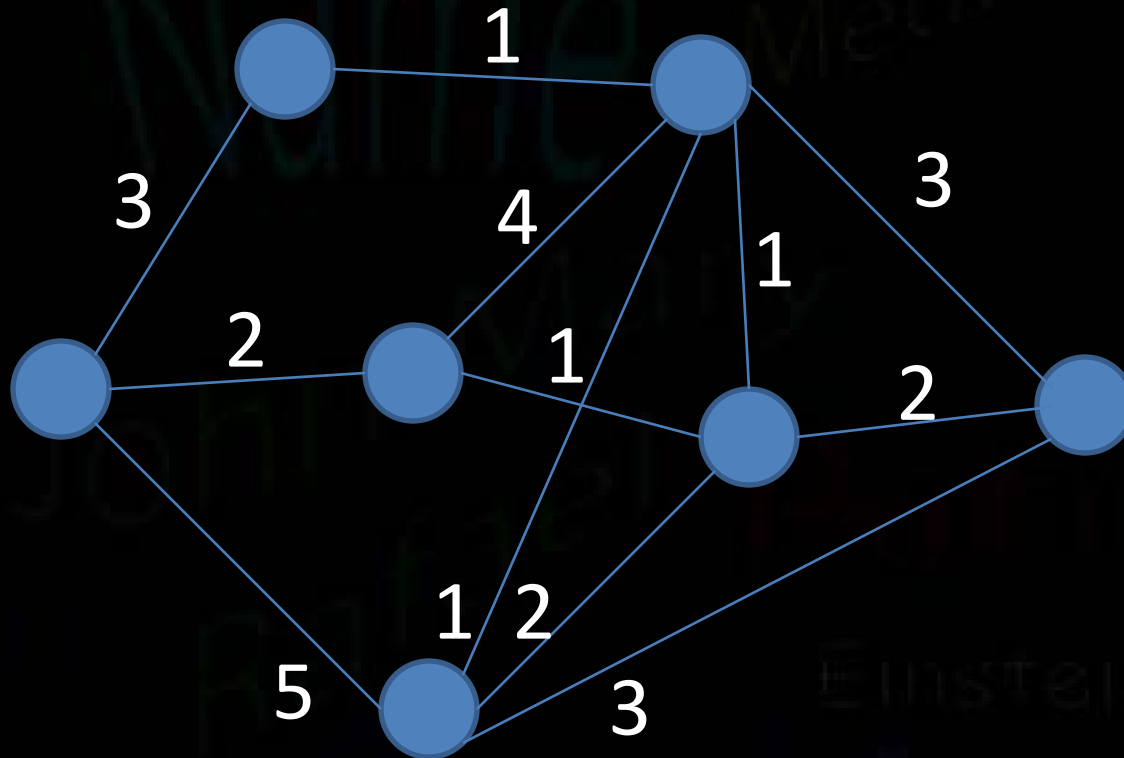

<http://www.sociopatterns.org/datasets/>

Experiments on SG Dataset (Daywise)

- The speaker i is chosen randomly from the population
- The hearer j is chosen preferentially among the neighbors ($w_{ij} \rightarrow$ number of 20 second intervals that i have face-to-face interaction with j)

$$p_{ij} = \frac{w_{ij}}{\sum_{j=1}^k w_{ij}}$$

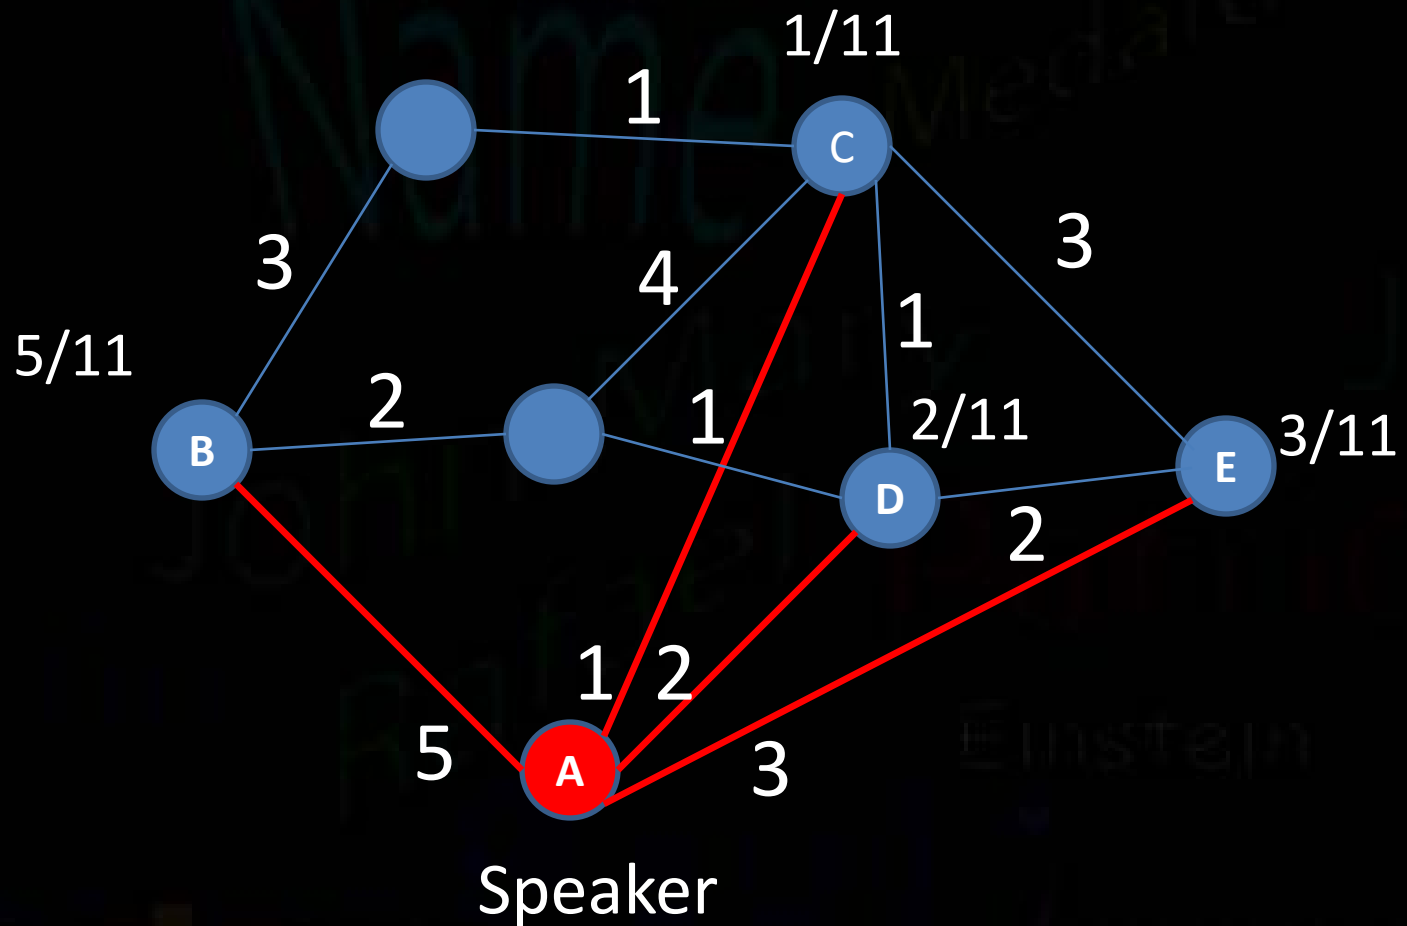

Experiments on SG Dataset (Daywise)

Experiments on SG Dataset (Daywise)

Experiments on SG Dataset (Daywise)

Experiments on SG Dataset (Daywise)

Experiments on SG Dataset (Daywise)

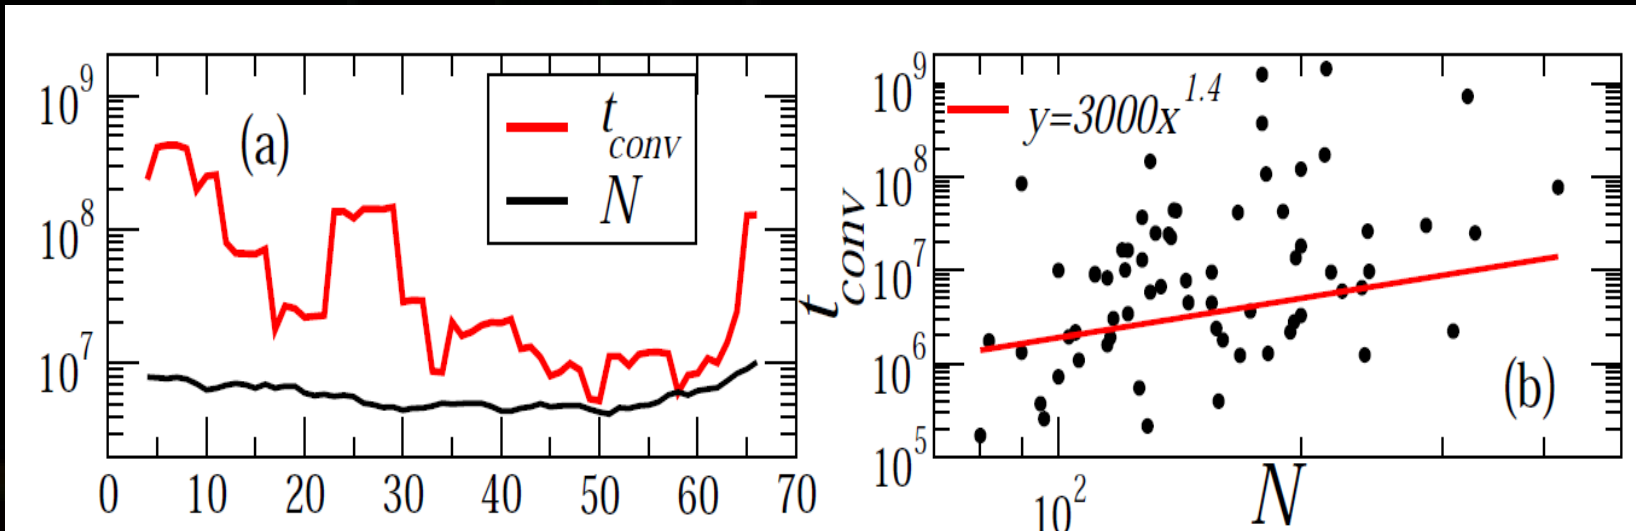

Scaling of N_w^{max} and t_{max}

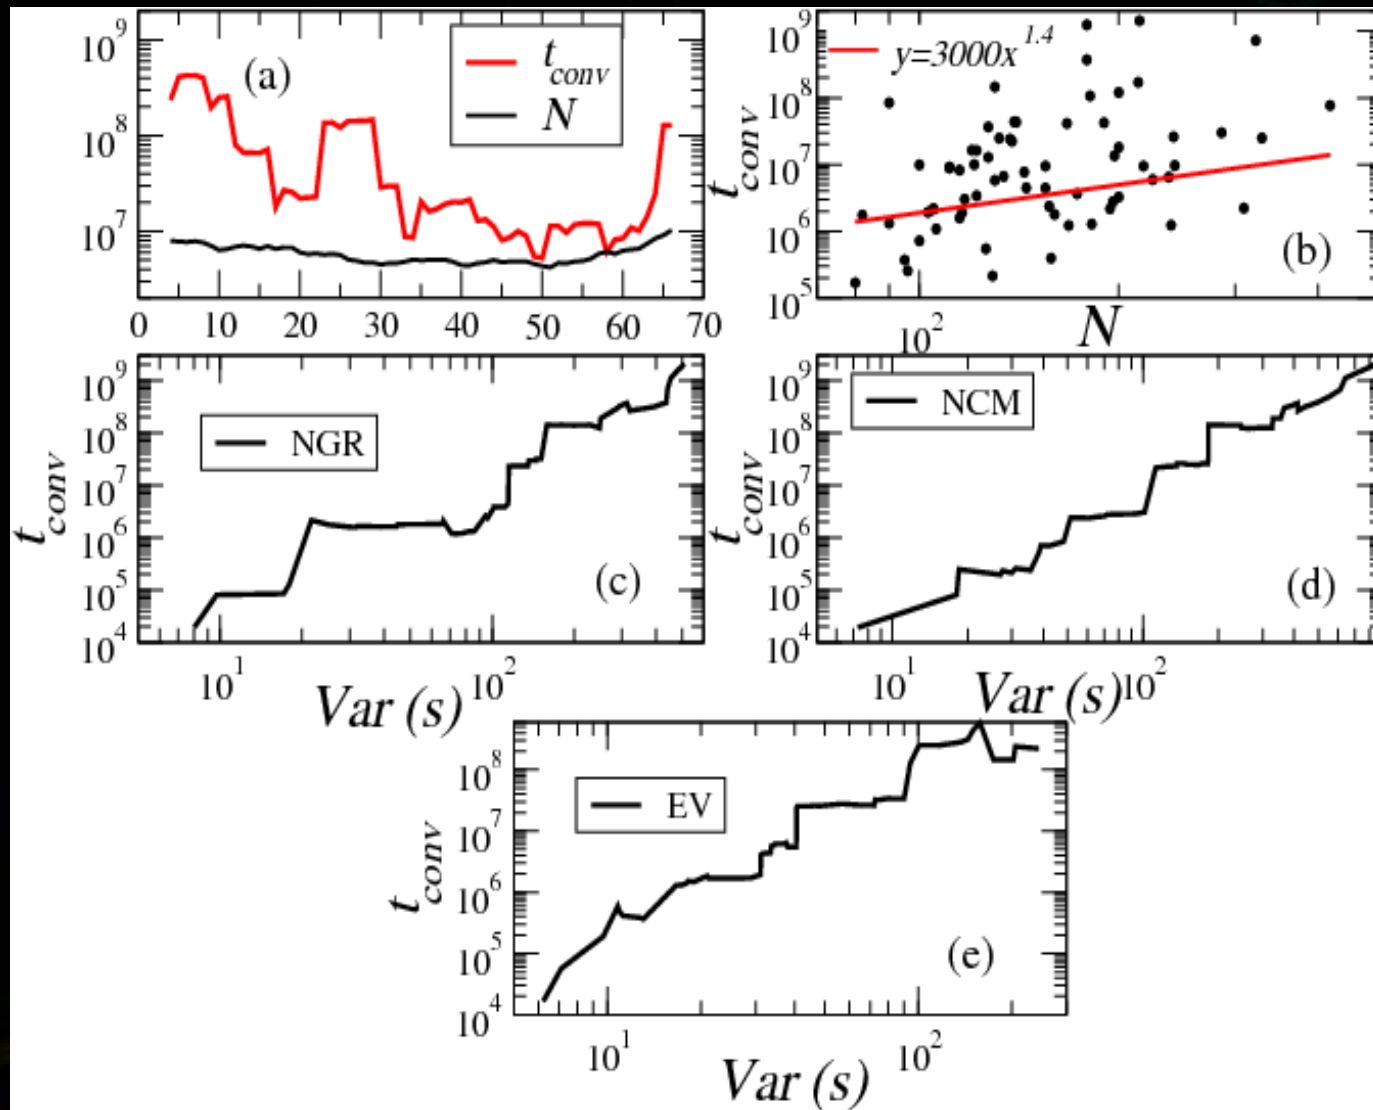

Scaling Relations

- $N_w^{\max} \sim O(N)$ [✓]
- $t_{\max} \sim O(N)$ [✓]
- But what about t_{conv} ? ~~$O(N^{1.4})$~~

Opinions trapped in communities

Examples of individual days

Daily Network	Connectedness	Convergence Type
Day 9	Connected	Slow
Day 20	Disconnected	Fast
Day 22	Connected	Fast
Day 26	Disconnected	Slow

Metrics

- Average unique words per community $U(t)$

$$U(t) = \frac{\sum_{i=1}^C |A_i|}{C}$$

- Average overlap of unique words across communities $O_c(t)$

$$O_c(t) = \frac{2}{C(C-1)} \sum_{i>j} \frac{2(|A_i \cap A_j|)}{\sqrt{2(|A_i|^2 + |A_j|^2)}}$$

A_i → list of unique words within community i ;

C → number of communities

Emergence of metastability

Metastability

3 phases

1. Steady growth
2. Reorganization
3. Long plateau

Multi-opinion states

Existence of multi-opinion states and metastability

Time resolved SG data

Day 9 (Results for all the other days are representative)

Composite Network

HT Dataset

Composite Network

Further Experiments

increases

diminishes

roughly stable

The new connections at each time step causes late-stage failures

More interaction favors similarity

Summary

The presence of community structure

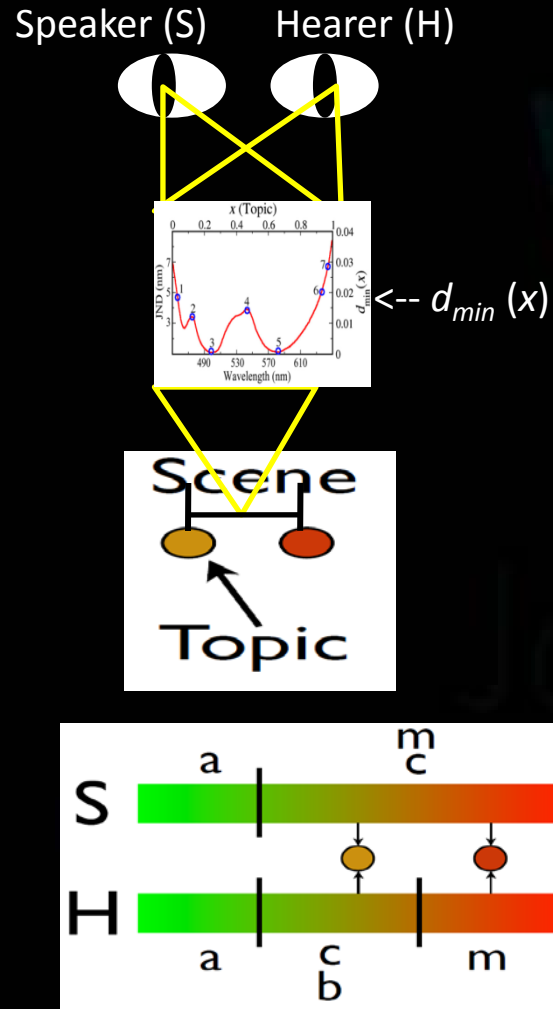

a continuous influx of new connections (leading to late-stage failures in the system)

steady growth of N_w in its final regime of evolution

Naming to Color Naming

Loreto, Mukherjee and Tria, On the origin of the hierarchy of color names, *PNAS* May 1, 2012 vol. 109 no. 18 6819-6824
