## Objectives

- **Congruences: Modular Arithmetic**
- **Euler Totient Function**
- **Fermat's Little Theorem**

# Congruences

- We say that  $a$  is congruent to  $b$  modulo  $m$ , and we write  $a \equiv b \pmod{m}$ , if  $m$  divides  $b-a$ .
- Example:  $-2 \equiv 19 \pmod{21}$ ,  $20 \equiv 0 \pmod{10}$ .
- Congruence modulo  $m$  is an equivalence relation on the integers.
  - any integer is congruent to itself modulo  $m$  (reflexivity)
  - $a \equiv b \pmod{m}$ , implies that  $b \equiv a \pmod{m}$  (symmetry)
  - $a \equiv b \pmod{m}$  and  $b \equiv c \pmod{m}$  implies  $a \equiv c \pmod{m}$  (transitivity)

## The following are equivalent

- $a \equiv b \pmod{m}$
- There is  $k \in \mathbb{Z}$ , with  $a = b + km$
- When divided by  $m$ , both  $a$  and  $b$  leave the same remainder.
- Equivalence Class of  $a \pmod{m}$  consists of all integers that are obtained by adding  $a$  with integral multiples of  $m$ 
  - called residue class of  $a \pmod{m}$

## Example

- **Residue class of 1 mod 4:**  
 $\{1, 1\pm 4, 1\pm 2\cdot 4, 1\pm 3\cdot 4, \dots\}$
- **The set of residue classes mod  $m$  is denoted by  $\mathbb{Z}/m\mathbb{Z}$ .**
  - it has  $m$  elements,  $0, 1, \dots, m-1$
  - this is called a complete set of incongruent residues (complete system)
  - Examples for complete system for mod 5 is:  
 $\{0, 1, \dots, 4\}, \{-12, -15, 82, -1, 31\}$  etc.

## Theorem

- **$a \equiv b \pmod{m}$ , and  $c \equiv d \pmod{m}$ , implies that  $-a \equiv -b \pmod{m}$ ,  $a + c \equiv b + d \pmod{m}$ , and  $ac \equiv bd \pmod{m}$ .**

## Example

Prove that  $2^{2^5} + 1$  is divisible by 641.

Note that:  $641 = 640 + 1 = 5 \cdot 2^7 + 1$ .

Thus,  $5 \cdot 2^7 \equiv -1 \pmod{641}$ .

$$\Rightarrow (5 \cdot 2^7)^4 \equiv (-1)^4 \pmod{641}$$

$$\Rightarrow 5^4 \cdot 2^{28} \equiv 1 \pmod{641}$$

$$\Rightarrow (625 \pmod{641}) \cdot 2^{28} \equiv 1 \pmod{641}$$

$$\Rightarrow (-2^4) \cdot 2^{28} \equiv 1 \pmod{641}$$

$$\Rightarrow 2^{32} \equiv -1 \pmod{641}$$

## Semigroups

- If  $X$  is a set, a map  $\circ: X \times X \rightarrow X$ , which transforms an element  $(x_1, x_2)$  to the element  $x_1 \circ x_2$  is called an operation.
- The sum of the residue classes  $a+m\mathbb{Z}$  and  $b+m\mathbb{Z}$  is  $(a+b)+m\mathbb{Z}$ .
- The product of the residue classes  $a+m\mathbb{Z}$  and  $b+m\mathbb{Z}$  is  $(a \cdot b)+m\mathbb{Z}$

## Semigroups

- An operation  $\circ$  on  $X$  is associative if  $(a \circ b) \circ c = a \circ (b \circ c)$ , for all  $a, b, c$  in  $X$ .
- It is commutative if  $a \circ b = b \circ a$  for all  $a, b$  in  $X$ .
- A pair  $(H, \circ)$  consisting of a set  $H$  and an associative operation  $\circ$  on  $H$  is called a semigroup.
- The semigroup is called abelian or commutative if the operation  $\circ$  is commutative.
  - Example:  $(\mathbb{Z}, +)$ ,  $(\mathbb{Z}, \cdot)$ ,  $(\mathbb{Z}/m\mathbb{Z}, +)$ ,  $(\mathbb{Z}/m\mathbb{Z}, \cdot)$

## Implications

- Let  $(H, \circ)$  be a semigroup.
- Set,  $a^1 = a$ ,  $a^{n+1} = a \circ a^n$  for  $a$  in  $H$  and natural value of  $n$ .
- Thus,  $a^n \circ a^m = a^{n+m}$ ,  $(a^n)^m = a^{nm}$ ,  $a$  in  $H$ ,  $n$  and  $m$  are natural values.
- If  $a, b$  are in  $H$ , and  $a \circ b = b \circ a$ , then:  
$$(a \circ b)^n = a^n \circ b^n$$

## Monoid

- A neutral element of the semigroup  $(H, \circ)$  is an element  $e$  in  $H$ , which satisfies  $e \circ a = a \circ e = a$ , for all  $a$  in  $H$ .
- If the semigroup contains a neutral element it is called monoid.
- A semigroup has at most one neutral element.
- If  $e \in H$  is a neutral element of the semigroup  $(H, \circ)$ , then  $b \in H$  is called an inverse of  $a$  if  $a \circ b = b \circ a = e$ .
- If  $a$  has an inverse, then  $a$  is called invertible in the semigroup  $H$ .
- In a monoid, each element has at most one inverse.

## Examples

- $(\mathbb{Z}, +)$ : Neutral element: 0, inverse:  $-a$ .
- $(\mathbb{Z}, \cdot)$ : Neutral element: 1, only invertible elements are +1 and -1.
- $(\mathbb{Z}/m\mathbb{Z}, +)$ : Neutral element:  $m\mathbb{Z}$ , inverse:  $-a + m\mathbb{Z}$ . Often is referred as  $\mathbb{Z}_m$ .
- $(\mathbb{Z}/m\mathbb{Z}, \cdot)$ : Neutral element:  $1 + m\mathbb{Z}$ , inverse: those elements,  $t$  which have  $\gcd(t, m) = 1$

## Groups

- A group is a monoid in which every element is invertible.
- The group is commutative or abelian if the monoid is commutative.
- Example:
  - $(\mathbb{Z}, +)$  is an abelian group.
  - $(\mathbb{Z}, \cdot)$  is not a group.
  - $(\mathbb{Z}/m\mathbb{Z}, +)$  is an abelian group.

## Residue class ring

- A ring is a triplet  $(R, +, \cdot)$  such that  $(R, +)$  is an abelian group and  $(R, \cdot)$  is a monoid.
- In addition:  $x \cdot (y + z) = (x \cdot y) + (x \cdot z)$  for  $x, y, z \in R$ .
- The ring is called commutative if the semigroup  $(R, \cdot)$  is commutative.
- A unit element of the ring is a neutral element of the semigroup  $(R, \cdot)$

## Unit Group

- Let  $R$  be a ring with unit element.
- An element  $a$  of  $R$  is called invertible or a unit, if it is invertible in the multiplicative semigroup of  $R$ .
- The element  $a$  is called a zero divisor if it is nonzero and there is a nonzero  $b$  in  $R$ , st.  $ab = 0$  or  $ba = 0$ .
- Units of a commutative ring form a group. This is called the unit group of the ring, denoted by  $R^*$ .

## Zero Divisors

- The zero divisors of the residue class  $\mathbb{Z}/m\mathbb{Z}$  is  $a + m\mathbb{Z}$ , with  $1 < \gcd(a, m) < m$ .
- Proof: If  $a + m\mathbb{Z}$  is a zero divisor of  $\mathbb{Z}/m\mathbb{Z}$ , then there is an integer  $b$  with  $ab \equiv 0 \pmod{m}$ , but neither  $a$  nor  $b$  is  $0 \pmod{m}$ . Thus,  $m \mid ab$ , but neither  $a$  nor  $b \Rightarrow 1 < \gcd(a, m) < m$ .
- Conversely, if  $1 < \gcd(a, m) < m$ , then define  $b = m/\gcd(a, m)$ , then both  $a$  and  $b$  are nonzero mod  $m$ . But  $ab \equiv 0 \pmod{m}$ . Thus  $a + m\mathbb{Z}$  is a zero divisor of  $\mathbb{Z}/m\mathbb{Z}$ .
- Corollary: If  $p$  is prime, then  $\mathbb{Z}/p\mathbb{Z}$  has no zero divisors.

## Field

- **A field is a commutative ring  $(R, +, \cdot)$  in which every element in the semigroup  $(R, \cdot)$  is invertible.**
- **Example:**
  - the set of integers is not a field.
  - the set of real and complex numbers form a field.
  - the residue class modulo a prime number except 0 is a field.

## Euler's Totient function

- **Suppose  $a \geq 1$  and  $m \geq 2$  are integers. If  $\gcd(a, m) = 1$ , then we say that  $a$  and  $m$  are relatively prime.**
- **The number of integers in  $Z_m$  ( $m > 1$ ), that are relatively prime to  $m$  and does not exceed  $m$  is denoted by  $\Phi(m)$ , called Euler's Totient function or phi function.**
- **$\Phi(1) = 1$**

## Example

- $m=26 \Rightarrow \Phi(26)=13$
- If  $p$  is prime,  $\Phi(p)=p-1$
- If  $n=1,2,\dots,24$  the values of  $\Phi(n)$  are:
  - 1,1,2,2,4,2,6,4,6,4,10,4,12,6,8,8,16,6,18,8,12,10,22,8
  - Thus we see that the function is very irregular.

## Properties of $\Phi$

- If  $m$  and  $n$  are relatively prime numbers,
  - $\Phi(mn) = \Phi(m) \Phi(n)$
- $\Phi(77) = \Phi(7 \times 11) = 6 \times 10 = 60$
- $\Phi(1896) = \Phi(3 \times 8 \times 79) = 2 \times 4 \times 78 = 624$
- This result can be extended to more than two arguments comprising of pairwise coprime integers.

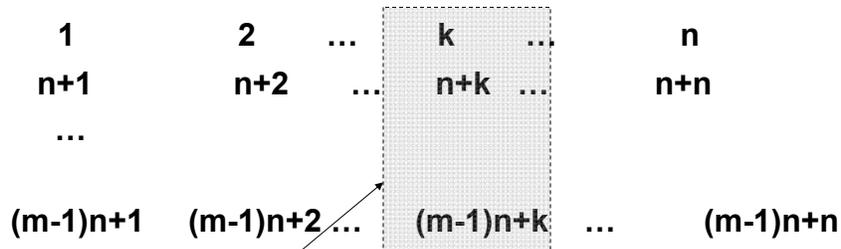

## Results

- If there are  $m$  terms of an arithmetic progression (AP) and has common difference prime to  $m$ , then the remainders form  $\mathbb{Z}_m$ .
- An integer  $a$  is relatively prime to  $m$ , iff its remainder is relatively prime to  $m$
- If there are  $m$  terms of an AP and has common difference prime to  $m$ , then there are  $\Phi(m)$  elements in the AP which are relatively prime to  $m$ .

## An Important Result

- If  $m$  and  $n$  are relatively prime,  

$$\Phi(mn) = \Phi(m)\Phi(n)$$

there are  $\Phi(m)$  elements which are co-prime to  $m$

there are  $\Phi(n)$  columns in which all the elements are co-prime to  $n$ .

contd.

- Thus, there are  $\Phi(n)$  columns with  $\Phi(m)$  elements in each which are co-prime to both  $m$  and  $n$ .
- Thus there are  $\Phi(m) \Phi(n)$  elements which are co-prime to  $mn$ .
  - This proves the result...

## Further Result

- $\Phi(p^a) = p^a - p^{a-1}$ 
    - Evident for  $a=1$
    - For  $a>1$ , out of the elements  $1, 2, \dots, p^a$  the elements  $p, p^2, p^{a-1}p$  are not co-prime to  $p^a$ .
- Rest are co-prime.  
Thus  $\Phi(p^a) = p^a - p^{a-1}$   
 $= p^a(1 - 1/p)$

contd.

- $n = p_1^{a_1} p_2^{a_2} \dots p_k^{a_k}$
- Thus,  $\Phi(n) = \Phi(p_1^{a_1}) \Phi(p_2^{a_2}) \dots \Phi(p_k^{a_k})$   
 $= n(1-1/p_1)(1-1/p_2)\dots(1-1/p_k)$

Thus, if  $m=60=4 \times 3 \times 5$

$$\Phi(60) = 60(1-1/2)(1-1/3)(1-1/5) = 16$$

## Fermat's Little Theorem

- If  $\gcd(a, m) = 1$ , then  $a^{\Phi(m)} \equiv 1 \pmod{m}$ .
- Proof:  $R = \{r_1, \dots, r_{\Phi(m)}\}$  is a reduced system (mod  $m$ ).
- If  $\gcd(a, m) = 1$ , we see that  $\{ar_1, \dots, ar_{\Phi(m)}\}$  is also a reduced system (mod  $m$ ).
- It is a permutation of the set  $R$ .
- Thus, the product of the elements in both the sets are the same.

$$\begin{aligned} \text{Hence, } a^{\Phi(m)} r_1, \dots, r_{\Phi(m)} &\equiv r_1, \dots, r_{\Phi(m)} \pmod{m} \\ \Rightarrow a^{\Phi(m)} &\equiv 1 \pmod{m} \end{aligned}$$

Note we can cancel the residues as they are co-prime with  $m$  and hence have multiplicative inverse.

## Example

- Find the remainder when  $72^{1001}$  is divided by 31.
- Since,  $72 \equiv 10 \pmod{31}$ . Hence,  $72^{1001} \equiv 10^{1001} \pmod{31}$ .
- Now from Fermat's Theorem,  $10^{30} \equiv 1 \pmod{31}$  [note 31 is prime]
- Raising both sides to the power 33,  
 $10^{990} \equiv 1 \pmod{31}$

Thus,

$$10^{1001} = 10^{990} 10^8 10^2 10 = 1(10^2)^4 10^2 10 = 1(7)^4 7 \cdot 10 = 49^2 \cdot 7 \cdot 10 = (-13)^2 \cdot 7 \cdot 10 = (14 \cdot 7) \cdot 10 = 98 \cdot 10 = 5 \cdot 10 = 19 \pmod{31}.$$

## Points to Ponder

- Find the least residue of  $7^{973} \pmod{72}$  [Note 72 is not a prime number].
