 LB for finding duplicates in a sorted list by comparisons

Chittaranjan Mandal (IIT Kharagpur)

.⊒...>

LB for finding duplicates in a sorted list is (n-1) by comparisons

- Assume there exists an algorithm A which runs in (n-2) comparisons which correctly finds duplicates in an ordered list of size n
- 2 Let X be a list such that $x_i = 2i$ for i = 1 to n, where all elements are unique.
- Sum algorithm A on input X; since it only takes (n 2) comparisons, there is at least 1 element which is not compared to its next element
- Sind that element $x_i = 2i$ and set $x_{i+1} = 2i$; note that previously, $x_{i+1} = 2(i + 1)$
- Rerun the algorithm; it will report no duplicates, as it did before, but wrongly this time

Thus, using a comparison based scheme it is not possible to find duplicates in a sorted list in less than (n - 1) comparisons

Section outline

LB by decision trees

Lower bound for searching

by comparison

• Lower bound for sorting by comparison

Chittaranjan Mandal (IIT Kharagpur)

- Decision tree must have one node for comparing ky to each A[i]
- An internal node produces at most two non-leaf nodes
- At most 2^k comparison nodes at level k, no comparisons at last level

- Decision tree must have one node for comparing ky to each A[i]
- An internal node produces at most two non-leaf nodes
- At most 2^k comparison nodes at level k, no comparisons at last level

• Max comparisons in k
levels:
$$\sum_{0}^{k-1} 2^i = 2^k - 1$$

Image: A mage: A ma

• Min *n* comparisons needed: $2^k - 1 \ge n \Rightarrow k \ge \lg(n+1) \Rightarrow k \in \Omega(\lg n)$

- Decision tree must have one node for comparing ky to each A[i]
- An internal node produces at most two non-leaf nodes
- At most 2^k comparison nodes at level k, no comparisons at last level

• Max comparisons in k
levels:
$$\sum_{0}^{k-1} 2^{i} = 2^{k} - 1$$

• Min *n* comparisons needed: $2^k - 1 \ge n \Rightarrow k \ge \lg(n+1) \Rightarrow k \in \Omega(\lg n)$

Binary search achieves this lower bound and so is asymptotically optim

Example (A decision tree of comparison based sorting for three distinct elements)

Comparison based sorting algorithms

A sorting algorithm is comparison based if the comparisons A[i] <
 A[j], A[i] ≤ A[j], A[i] = A[j], A[i] ≥ A[j], A[i] > A[j] are the only ways
 in which it decides on the action on the input elements

Comparison based sorting algorithms

- A sorting algorithm is comparison based if the comparisons A[i] <
 A[j], A[i] ≤ A[j], A[i] = A[j], A[i] ≥ A[j], A[i] > A[j] are the only ways
 in which it decides on the action on the input elements
- Bubble sort, selection sort, insertion sort, quick sort, merge sort, heap sort (to be covered) are all comparison based

Decision tree for sorting by comparison

- Possible traces of a comparison based sorting algorithm can be captured by a decision tree
- Each node has three outcomes (<, =, >) in general, but two if the keys are distinct (a restricted case)

Chittaranjan Mandal (IIT Kharagpur)

Algorithms

- Each leaf is a permutation of elements based on the decision sequence
- *n*! permutations *must* be covered

April 17, 2017

- Each leaf is a permutation of elements based on the decision sequence
- *n*! permutations *must* be covered
- Let the binary decision tree be of height h
- It will have at most 2^h leaves terminal decisions
- These terminal decisions must cover at least the n! possibilities

• Thus, $n! \leq 2^h \Rightarrow h \geq \lg(n!)$

April 17, 2017

9/9

- Each leaf is a permutation of elements based on the decision sequence
- *n*! permutations *must* be covered
- Let the binary decision tree be of height h
- It will have at most 2^h leaves terminal decisions
- These terminal decisions must cover at least the n! possibilities

• Thus,
$$n! \leq 2^h \Rightarrow h \geq \lg(n!)$$

• Now
$$n! \ge \left(\frac{n}{2}\right)^{\frac{n}{2}}$$
, therefore,
 $\lg(n!) \ge \lg\left(\frac{n}{2}^{\frac{n}{2}}\right) = \frac{n}{2}\lg\left(\frac{n}{2}\right) = \frac{n}{2}(\lg n - \lg 2)$

• Thus,
$$h \ge \lg n! \ge \frac{n}{2}(\lg n - \lg 2) \Rightarrow \frac{h \in \Omega(n \lg n)}{2}$$

- Each leaf is a permutation of elements based on the decision sequence
- *n*! permutations *must* be covered
- Let the binary decision tree be of height h
- It will have at most 2^h leaves terminal decisions
- These terminal decisions must cover at least the n! possibilities

• Thus,
$$n! \leq 2^h \Rightarrow h \geq \lg(n!)$$

• Now
$$n! \ge \left(\frac{n}{2}\right)^{\frac{n}{2}}$$
, therefore,
 $\lg(n!) \ge \lg\left(\frac{n}{2}^{\frac{n}{2}}\right) = \frac{n}{2}\lg\left(\frac{n}{2}\right) = \frac{n}{2}(\lg n - \lg 2)$

- Thus, $h \ge \lg n! \ge \frac{n}{2}(\lg n \lg 2) \Rightarrow \frac{h \in \Omega(n \lg n)}{2}$
- No loss of generality in considering the special case of all distinct elements, as this case *must* be covered by the sorting technique

Chittaranjan Mandal (IIT Kharagpur)
