const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

- const-ness and cv-qualifier
  - Notion of const
  - Advantages of const
    - Natural Constants –  $\pi$ ,  $e$
    - Program Constants – array size
    - Prefer const to #define
  - const and pointer
    - const-ness of pointer / pointe. How to decide?
  - Notion of volatile
- inline functions
  - Macros with params
    - Advantages
    - Disadvantages
  - Notion of inline functions
    - Advantages

# Program 06.01: Manifest constants in C

- Manifest constants are defined by #define
- Manifest constants are replaced by CPP (C Pre-Processor)

Source Program	Program after CPP
<pre>#include &lt;iostream&gt; #include &lt;cmath&gt; using namespace std;  #define TWO 2 #define PI 4.0*atan(1.0)  int main() {     int r = 10;     double peri =         TWO * PI * r;     cout &lt;&lt; "Perimeter = "         &lt;&lt; peri &lt;&lt; endl;     return 0; }</pre>	<pre>// Contents of &lt;iostream&gt; header replaced by CPP // Contents of &lt;cmath&gt; header replaced by CPP using namespace std;  // #define of TWO consumed by CPP // #define of PI consumed by CPP  int main() {     int r = 10;     double peri =         2 * 4.0*atan(1.0) * r; // Replaced by CPP     cout &lt;&lt; "Perimeter = "         &lt;&lt; peri &lt;&lt; endl;     return 0; }</pre>
Perimeter = 314.159	Perimeter = 314.159
<ul style="list-style-type: none"><li>● TWO is a manifest constant</li><li>● PI is a manifest constant</li><li>● TWO &amp; PI look like variables</li></ul>	<ul style="list-style-type: none"><li>● CPP replaces the token TWO by 2</li><li>● CPP replaces the token PI by 4.0*atan(1.0)</li><li>● Compiler sees them as constants</li></ul>

# Notion of const-ness

- The value of a const variable cannot be changed after definition

```
const int n = 10; // n is an int type variable with value 10
                // n is a constant
...
n = 5; // Is a compilation error as n cannot be changed
...
int m;
int *p = 0;
p = &m; // Hold m by pointer p
*p = 7; // Change m by p; m is now 7
...
p = &n; // Is a compilation error as n may be changed by *p = 5;
```

- Naturally, a const variable *must be initialized when defined*

```
const int n; // Is a compilation error as n must be initialized
```

- A variable of any data type can be declared as const

```
typedef struct _Complex {
    double re;
    double im;
} Complex;
const Complex c = {2.3, 7.5}; // c is a Complex type variable
                          // It is initialized with c.re = 2.3 and c.im = 7.5
                          // c is a constant
...
c.re = 3.5; // Is a compilation error as no part of c can be changed
```

Module 06

# Program 06.02: Compare #define and const

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

### Using #define

```
#include <iostream>
#include <cmath>
using namespace std;

#define TWO 2
#define PI 4.0*atan(1.0)

int main() {
    int r = 10;
    double peri =
        TWO * PI * r;
    cout << "Perimeter = "
        << peri << endl;
    return 0;
}
```

Perimeter = 314.159

- TWO is a manifest constant
- PI is a manifest constant
- TWO & PI look like variables
- Types of TWO & PI may be indeterminate

### Using const

```
#include <iostream>
#include <cmath>
using namespace std;

const int TWO = 2;
const double PI = 4.0*atan(1.0);

int main() {
    int r = 10;
    double peri =
        TWO * PI * r; // No replacement by CPP
    cout << "Perimeter = "
        << peri << endl;
    return 0;
}
```

Perimeter = 314.159

- TWO is a const variable initialized to 2
- PI is a const variable initialized to 4.0\*atan(1.0)
- TWO & PI are variables
- Type of TWO is const int
- Type of PI is const double

# Advantages of const

- Natural Constants like  $\pi$ ,  $e$ ,  $\Phi$  (*Golden Ratio*) etc. can be compactly defined and used

```
const double pi = 4.0*atan(1.0);           // pi = 3.14159
const double e = exp(1.0);                 // e = 2.71828
const double phi = (sqrt(5.0) + 1) / 2.0; // phi = 1.61803

const int TRUE = 1;                        // Truth values
const int FALSE = 0;

const int null = 0;                        // null value
```

Note: NULL is a manifest constant in C/C++ set to 0.

- Program Constants like number of elements, array size etc. can be defined at one place (at times in a header) and used all over the program

```
const int nArraySize = 100;
const int nElements = 10;

int main() {
    int A[nArraySize];           // Array size
    for (int i = 0; i < nElements; ++i) // Number of elements
        A[i] = i * i;

    return 0;
}
```

# Advantages of const

## ● Prefer const over #define

### Using #define

#### Manifest Constant

- Is not type safe
- Replaced textually by CPP
- Cannot be *watched* in debugger
- Evaluated as many times as replaced

### Using const

#### Constant Variable

- Has its type
- Visible to the compiler
- Can be *watched* in debugger
- Evaluated only on initialization

Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

- const-ness can be used with Pointers in one of the two ways:
  - **Pointer to Constant data** where the pointee (pointed data) cannot be changed
  - **Constant Pointer** where the pointer (address) cannot be changed
- Consider usual pointer-pointee computation (without const):

```
int m = 4;
int n = 5;
int * p = &n; // p points to n. *p is 5
...
n = 6;        // n and *p are 6 now
*p = 7;       // n and *p are 7 now. POINTEE changes
...
p = &m;       // p points to m. *p is 4. POINTER changes
*p = 8;       // m and *p are 8 now. n is 7. POINTEE changes
```

# const and Pointers: *Pointer to Constant data*

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

## Consider pointed data

```
int m = 4;
const int n = 5;
const int * p = &n;
...
n = 6; // Error: n is constant and cannot be changed
*p = 7; // Error: p points to a constant data (n) that cannot be changed
p = &m; // Okay
*p = 8; // Okay
```

## Interestingly,

```
int n = 5;
const int * p = &n;
...
n = 6; // Okay
*p = 6; // Error: p points to a 'constant' data (n) that cannot be changed
```

## Finally,

```
const int n = 5;
int * p = &n; // Error: If this were allowed, we would be able to change constant n
...
n = 6; // Error: n is constant and cannot be changed
*p = 6; // Would have been okay, if declaration of p were valid
```

# const and Pointers: Example

Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

What will be the output of the following program:

```
#include <iostream>
using namespace std;

int main() {
    const int a = 5;
    int *b;
    b = (int *) &a;
    *b = 10;
    cout << a << " " <<b<<" " << &a <<" " << *b <<"\n";
}
```

# const and Pointers: Example

Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness  
Advantages

Pointers  
volatile

inline  
functions

Macros  
inline

Summary

What will be the output of the following program:

```
#include <iostream>
using namespace std;

int main() {
    const int a = 5;
    int *b;
    b = (int *) &a;
    *b = 10;
    cout << a << " " <<b<<" " << &a <<" " << *b <<"\n";
}
```

---

Standard g++ compiler prints: 5 0x16b58f4ec 0x16b58f4ec 10  
b actually points to a

But when accessed through a the compiler substitutes the constant expression  
Technically the behavior is **undefined**

# const and Pointers: *Constant Pointer*

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

## Consider pointer

```
int m = 4, n = 5;
int * const p = &n;
...
n = 6; // Okay
*p = 7; // Okay. Both n and *p are 7 now
...
p = &m; // Error: p is a constant pointer and cannot be changed
```

## By extension, both can be const

```
const int m = 4;
const int n = 5;
const int * const p = &n;
...
n = 6; // Error: n is constant and cannot be changed
*p = 7; // Error: p points to a 'constant' data (n) that cannot be changed
...
p = &m; // Error: p is a constant pointer and cannot be changed
```

## Finally, to decide on const-ness, draw a mental line through \*

```
int n = 5;
int * p = &n;           // non-const-Pointer to non-const-Pointee
const int * p = &n;     // non-const-Pointer to const-Pointee
int * const p = &n;     // const-Pointer to non-const-Pointee
const int * const p = &n; // const-Pointer to const-Pointee
```

# const and Pointers: The case of C-string

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

Consider the example:

```
char * str = strdup("IIT, Kharagpur");  
str[0] = 'N'; // Edit the name  
cout << str << endl;  
str = strdup("JIT, Kharagpur"); // Change the name  
cout << str << endl;
```

Output is:

```
NIT, Kharagpur  
JIT, Kharagpur
```

To stop editing the name:

```
const char * str = strdup("IIT, Kharagpur");  
str[0] = 'N'; // Error: Cannot Edit the name  
str = strdup("JIT, Kharagpur"); // Change the name
```

To stop changing the name:

```
char * const str = strdup("IIT, Kharagpur");  
str[0] = 'N'; // Edit the name  
str = strdup("JIT, Kharagpur"); // Error: Cannot Change the name
```

To stop both:

```
const char * const str = strdup("IIT, Kharagpur");  
str[0] = 'N'; // Error: Cannot Edit the name  
str = strdup("JIT, Kharagpur"); // Error: Cannot Change the name
```

# Notion of `volatile`

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

`const`-ness &  
`cv`-qualifier

`const`-ness

Advantages

Pointers

`volatile`

`inline`  
functions

Macros

`inline`

Summary

- Variable Read-Write
  - The value of a variable can be read and / or assigned at any point of time
  - The value assigned to a variable does not change till a next assignment is made (value is persistent)
- `const`
  - The value of a `const` variable can be set only at initialization – cannot be changed afterwards
- `volatile`
  - *In contrast*, the value of a `volatile` variable may be different every time it is read – *even if no assignment has been made to it*
  - A variable is taken as `volatile` if it can be changed by hardware, the kernel, another thread etc.
- `cv`-qualifier: A declaration may be prefixed with a qualifier – `const` or `volatile`

# Using volatile

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

**volatile**

inline  
functions

Macros

inline

Summary

Consider:

```
static int i;  
void fun(void) {  
    i = 0;  
    while (i != 100);  
}
```

This is an infinite loop! Hence the compiler should optimize as:

```
static int i;  
void fun(void) {  
    i = 0;  
    while (1);           // Compiler optimizes  
}
```

Now qualify `i` as `volatile`:

```
static volatile int i;  
void fun(void) {  
    i = 0;  
    while (i != 100); // Compiler does not optimize  
}
```

Being `volatile`, `i` can be changed by hardware anytime. It waits till the value becomes 100 (possibly some hardware writes to a port).

# Program 06.03: Macros with Parameters

- Macros with Parameters are defined by #define
- Macros with Parameters are replaced by CPP

Source Program	Program after CPP
<pre>#include &lt;iostream&gt; using namespace std;  #define SQUARE(x) x * x  int main() {     int a = 3, b;      b = SQUARE(a);      cout &lt;&lt; "Square = "          &lt;&lt; b &lt;&lt; endl;     return 0; }</pre>	<pre>// Contents of &lt;iostream&gt; header replaced by CPP using namespace std;  // #define of SQUARE(x) consumed by CPP  int main() {     int a = 3, b;      b = a * a; // Replaced by CPP      cout &lt;&lt; "Square = "          &lt;&lt; b &lt;&lt; endl;     return 0; }</pre>
Square = 9	Square = 9
<ul style="list-style-type: none"><li>• SQUARE(x) is a macro with one param</li><li>• SQUARE(x) looks like a function</li></ul>	<ul style="list-style-type: none"><li>• CPP replaces the SQUARE(x) substituting x with a</li><li>• Compiler does not see it as function</li></ul>

Module 06

Sourangshu

# Pitfalls of macros

Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

Consider the example:

```
#include <iostream>
using namespace std;

#define SQUARE(x) x * x

int main() {
    int a = 3, b;

    b = SQUARE(a + 1); // Wrong macro expansion

    cout << "Square = " << b << endl;

    return 0;
}
```

Output is 7 in stead of 16 as expected. On the expansion line it gets:

```
b = a + 1 * a + 1;
```

To fix:

```
#define SQUARE(x) (x) * (x)
```

Now:

```
b = (a + 1) * (a + 1);
```

# Pitfalls of macros

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

inline

Summary

## Continuing ...

```
#include <iostream>
using namespace std;

#define SQUARE(x) (x) * (x)

int main() {
    int a = 3, b;

    b = SQUARE(++a);

    cout << "Square = " << b << endl;

    return 0;
}
```

Output is 25 in stead of 16 as expected. On the expansion line it gets:

```
b = (++a) * (++a);
```

and a is incremented twice before being used! There is no easy fix.

# inline Function

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

**inline**

Summary

- An `inline` function is just another functions
- The function prototype is preceded by the keyword `inline`
- An `inline` function is expanded (inlined) at the site of its call and the overhead of passing parameters between caller and callee (or called) functions is avoided

# Program 06.04: Macros as inline Functions

- Define the function
- Prefix function header with `inline`
- Compile function body and function call together

Using macro	Using inline
<pre>#include &lt;iostream&gt; using namespace std; #define SQUARE(x) x * x int main() {     int a = 3, b;     b = SQUARE(a);     cout &lt;&lt; "Square = "          &lt;&lt; b &lt;&lt; endl;     return 0; }</pre>	<pre>#include &lt;iostream&gt; using namespace std; inline int SQUARE(int x) { return x * x; } int main() {     int a = 3, b;     b = SQUARE(a);     cout &lt;&lt; "Square = "          &lt;&lt; b &lt;&lt; endl;     return 0; }</pre>
Square = 9	Square = 9
<ul style="list-style-type: none"><li>● <code>SQUARE(x)</code> is a macro with one param</li><li>● Macro <code>SQUARE(x)</code> is efficient</li><li>● <code>SQUARE(a + 1)</code> fails</li><li>● <code>SQUARE(++a)</code> fails</li><li>● <code>SQUARE(++a)</code> does not check type</li></ul>	<ul style="list-style-type: none"><li>● <code>SQUARE(x)</code> is a function with one param</li><li>● <code>inline SQUARE(x)</code> is equally efficient</li><li>● <code>SQUARE(a + 1)</code> works</li><li>● <code>SQUARE(++a)</code> works</li><li>● <code>SQUARE(++a)</code> checks type</li></ul>

# Macros & inline Functions: Compare and Contrast

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

const-ness &  
cv-qualifier

const-ness

Advantages

Pointers

volatile

inline  
functions

Macros

**inline**

Summary

### Macros

- Expanded at the place of calls
- Efficient in execution
- Code bloats
- Has syntactic and semantic pitfalls
- Type checking for parameters is not done
- Helps to write `max / swap` for all types
- Errors are not checked during compilation
- Not available to debugger

### inline Functions

- Expanded at the place of calls
- Efficient in execution
- Code bloats
- No pitfall
- Type checking for parameters is robust
- Needs `template` for the same purpose
- Errors are checked during compilation
- Available to debugger in `DEBUG` build

# Limitations of Function `inline`

## Module 06

Sourangshu  
Bhattacharya

Objectives &  
Outline

`const-ness` &  
`cv-qualifier`

`const-ness`

Advantages

Pointers

`volatile`

`inline`  
functions

Macros

**`inline`**

Summary

- `inline`ing is a directive – compiler may not inline functions with large body
- `inline` functions may not be recursive
- Function body is needed for `inline`ing at the time of function call. Hence, implementation hiding is not possible. *Implement inline functions in header files*
- `inline` functions must not have two different definitions

# Module Summary
