Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Motivation: Example `CreateWindow` in MSDN

Declaration of CreateWindow	Calling CreateWindow
| ```
HWND WINAPI CreateWindow(
    _In_opt_ LPCTSTR   lpClassName,
    _In_opt_ LPCTSTR   lpWindowName,
    _In_     DWORD     dwStyle,
    _In_     int       x,
    _In_     int       y,
    _In_     int       nWidth,
    _In_     int       nHeight,
    _In_opt_ HWND      hWndParent,
    _In_opt_ HMENU     hMenu,
    _In_opt_ HINSTANCE hInstance,
    _In_opt_ LPVOID    lpParam
);
``` | ```
hWnd = CreateWindow(
    ClsName,
    WndName,
    WS_OVERLAPPEDWINDOW,
    CW_USEDEFAULT,
    CW_USEDEFAULT,
    CW_USEDEFAULT,
    CW_USEDEFAULT,
    NULL,
    NULL,
    hInstance,
    NULL
);
``` |

- There are 11 Number of parameters in `CreateWindow()`

- Out of these 11, 7 parameters (4 are `CWUSEDEFAULT` and 3 are `NULL`) usually get fixed values in a call

- Instead of using these 7 fixed valued Parameters at the time of calling, we could have avoided those by assigning those value much earlier in function formal parameter

- C++ allows us to do so through the mechanism called **Default parameters**

```
#include <iostream>
using namespace std;

int IdentityFunction(int a = 10) { // Default value for the parameter
    return (a);
}

int main() {
    int x = 5, y;

    y = IdentityFunction(x);  // Usual function call
    cout << "y = " << y << endl;

    y = IdentityFunction();   // Uses default parameter
    cout << "y = " << y << endl;
}
----------
y = 5
y = 10
```

```cpp
#include<iostream>
using namespace std;

int Add(int a = 10, int b = 20) {
    return (a + b);
}
int main(){
    int x = 5, y = 6, z;

    z = Add(x, y); // Usual function call -- a = x = 5 & b = y = 6
    cout << "Sum = " << z << endl;

    z = Add(x);    // One parameter defaulted -- a = x = 5 & b = 20
    cout << "Sum = " << z << endl;

    z = Add();     // Both parameter defaulted -- a = 10 & b = 20
    cout << "Sum = " << z << endl;
}
----------
Sum = 11
Sum = 25
Sum = 30
```

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Default Parameter: Highlighted Points

- C++ allows programmer to assign default values to the function parameters
- Default values are specified while prototyping the function
- Default parameters are required while calling functions with fewer arguments or without any argument
- Better to use default value for less used parameters
- Default arguments may be expressions also

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Restrictions on default parameters

- All parameters to the right of a parameter with default argument must have default arguments (function f)
- Default arguments cannot be re-defined (function g)
- All non-defaulted parameters needed in a call (call g())

```
#include <iostream>

void f(int, double = 0.0, char *);
// Error C2548: 'f': missing default parameter for parameter 3

void g(int, double = 0, char * = NULL); // OK
void g(int, double = 1, char * = NULL);
// Error C2572: 'g': redefinition of default parameter : parameter 3
// Error C2572: 'g': redefinition of default parameter : parameter 2

int main() {
    int i = 5; double d = 1.2; char c = 'b';

    g(); // Error C2660: 'g': function does not take 0 arguments
    g(i);
    g(i, d);
    g(i, d, &c);
    return 0;
}
```

Restrictions on default parameters

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

- Default parameters should be supplied only in a header file and not in the definition of a function

```
// Header file: myFunc.h
void g(int, double, char = 'a');
----------------------------------------------------
// Source File: myFunc.cpp
#include <iostream>
using namespace std;
#include "myFunc.h"

void g(int i, double d, char c) {
    cout << i << ' ' << d << ' ' << c << endl;
}
----------------------------------------------------
// Application File: Apps.cpp
#include <iostream>
#include "myFunc.h"
// void g(int, double, char = 'a');

void g(int i, double f = 0.0, char ch); // OK { a new overload
void g(int i = 0, double f, char ch);   // OK { a new overload
int main() {
    int i = 5; double d = 1.2; char c = 'b';

    g();            // Prints: 0 0 a
    g(i);           // Prints: 5 0 a
    g(i, d);        // Prints: 5 1.2 a
    g(i, d, c);     // Prints: 5 1.2 b
    return 0;
}
```

Overloading

Summary

Function overloads: Matrix Multiplication in C

- Similar functions with different data types & algorithms

```
typedef struct { int data[10][10]; } Mat;     // 2D Matrix
typedef struct { int data[1][10];  } VecRow; // Row Vector
typedef struct { int data[10][1];  } VecCol; // Column Vector

void Multiply_M_M  (Mat a,    Mat b,    Mat* c)    { /* c = a * b */ }
void Multiply_M_VC (Mat a,    VecCol b, VecCol* c) { /* c = a * b */ }
void Multiply_VR_M (VecRow a, Mat b,    VecRow* c) { /* c = a * b */ }
void Multiply_VC_VR(VecCol a, VecRow b, Mat* c)    { /* c = a * b */ }
void Multiply_VR_VC(VecRow a, VecCol b, int* c)    { /* c = a * b */ }

int main() {
    Mat m1, m2, rm; VecRow rv, rrv; VecCol cv, rcv; int r;
    Multiply_M_M  (m1, m2, &rm);  // rm  <-- m1 * m2
    Multiply_M_VC (m1, cv, &rcv); // rcv <-- m1 * cv
    Multiply_VR_M (rv, m2, &rrv); // rrv <-- rv * m2
    Multiply_VC_VR(cv, rv, &rm);  // rm  <-- cv * rv
    Multiply_VR_VC(rv, cv, &r);   // r   <-- rv * cv
    return 0;
}
```

- 5 multiplication functions share same functionality but different
  argument types
- C treats them as 5 separate functions
- C++ has an elegant solution

Function overloads: Matrix Multiplication in C++

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

- Functions having similar functionality but different in details.

```
typedef struct { int data[10][10]; } Mat;    // 2D Matrix
typedef struct { int data[1][10]; } VecRow;  // Row Vector
typedef struct { int data[10][1]; } VecCol;  // Column Vector

void Multiply(const Mat& a,    const Mat& b,    Mat& c)    { /* c = a * b */ };
void Multiply(const Mat& a,    const VecCol& b, VecCol& c) { /* c = a * b */ };
void Multiply(const VecRow& a, const Mat& b,    VecRow& c) { /* c = a * b */ };
void Multiply(const VecCol& a, const VecRow& b, Mat& c)    { /* c = a * b */ };
void Multiply(const VecRow& a, const VecCol& b, int& c)    { /* c = a * b */ };

int main() {
    Mat m1, m2, rm; VecRow rv, rrv; VecCol cv, rcv; int r;
    Multiply(m1, m2, rm);  // rm  <-- m1 * m2
    Multiply(m1, cv, rcv); // rcv <-- m1 * cv
    Multiply(rv, m2, rrv); // rrv <-- rv * m2
    Multiply(cv, rv, rm);  // rm  <-- cv * rv
    Multiply(rv, cv, r);   // r   <-- rv * cv
    return 0;
}
```

- These 5 functions having different argument types are treated
  as one function (Multiply) in C++

- This is called **Function Overloading or Static Polymorphism**

Program 08.03/04: Function Overloading

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

- Define multiple functions having the same name
- Binding happens at compile time

Same # of Parameters	Different # of Parameters

```cpp
#include <iostream>
using namespace std;
int Add(int a, int b) { return (a + b); }
double Add(double c, double d) {
    return (c + d);
}
int main() {
    int x = 5, y = 6, z;
    z = Add(x, y);
        // int Add(int, int)
    cout << "int sum = " << z;

    double s = 3.5, t = 4.25, u;
    u = Add(s, t);
        // double Add(double, double)
    cout << "double sum = " << u << endl;

    return 0;
}
```

```cpp
#include <iostream>
using namespace std;
int Area(int a, int b) { return (a * b); }
int Area(int c) {
    return (c * c);
}
int main(){
    int x = 10, y = 12, z = 5, t;
    t = Area(x, y);
        // int Add(int, int)
    cout << "Area of Rectangle = " << t;

    int z = 5, u;
    u = Area(z);
        // int Add(int)
    cout << " Area of Square = " << u << endl;

    return 0;
}
```

int sum = 11 double sum = 7.75	Area of Rectangle = 12 Area of Square = 25
• Same Add function	• Same Area function
• Same # of parameters but different types	• Different # of parameters

Module 08

Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Program 08.05: Restrictions in Function Overloading

- Two functions having the same signature but different return types cannot be overloaded

```cpp
#include <iostream>
using namespace std;

int    Area(int a, int b) { return (a * b); }
double Area(int a, int b) { return (a * b); }
// Error C2556: 'double Area(int,int)': overloaded function differs only by return type
//              from 'int Area(int,int)'
// Error C2371: 'Area': redefinition; different basic types

int main() {
    int x = 10, y = 12, z = 5, t;
    double f;

    t = Area(x, y);
    // Error C2568: '=': unable to resolve function overload
    // Error C3861: 'Area': identifier not found

    cout << "Multiplication = " << t << endl;

    f = Area(y, z); // Errors C2568 and C3861 as above
    cout << "Multiplication = " << f << endl;

    return 0;
}
```

- The same function name may be used in several definitions

- Functions with the same name must have different number of formal parameters and/or different types of formal parameters

- Function selection is based on the number and the types of the actual parameters at the places of invocation

- Function selection (Overload Resolution) is performed by the compiler

- Two functions having the same signature but different return types will result in a compilation error due to *attempt to re-declare*

- Overloading allows **Static Polymorphism**

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Overload Resolution

- To resolve overloaded functions with one parameter
    - Identify the set of *Candidate Functions*
    - From the set of candidate functions identify the set of *Viable Functions*
    - Select the *Best viable function* through (*Order is important*)
        - Exact Match
        - Promotion
        - Standard type conversion
        - User defined type conversion

Overload Resolution: Exact Match

- lvalue-to-rvalue conversion
    - Most common
- Array-to-pointer conversion
  Definitions: `int ar[10];`
                           `void f(int *a);`
  Call: `f(ar)`
- Function-to-pointer conversion
  Definitions: `typedef int (*fp) (int);`
                           `void f(int, fp);`
                           `int g(int);`
  Call: `f(5, g)`
- Qualification conversion
    - Converting pointer (only) to const pointer

- Examples of Promotion
    - char to int; float to double
    - enum to int / short / unsigned int / ...
    - bool to int
- Examples of Standard Conversion
    - integral conversion
    - floating point conversion
    - floating point to integral conversion
      The above 3 may be dangerous!
    - pointer conversion
    - bool conversion

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

**Overload
Resolution**

Default
Parameters in
Overloading

Summary

Example: Overload Resolution with one parameter

- In the context of a list of function prototypes:

```
int g(double);                // F1
void f();                     // F2
void f(int);                  // F3
double h(void);               // F4
int g(char, int);             // F5
void f(double, double = 3.4); // F6
void h(int, double);          // F7
void f(char, char *);         // F8
```

  The call site to resolve is:

```
f(5.6);
```

- Resolution:
    - Candidate functions (by name): F2, F3, F6, F8
    - Viable functions (by # of parameters): F3, F6
    - Best viable function (by type double – Exact Match): F6

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Example: Overload Resolution fails

• Consider the overloaded function signatures:

```
int fun(float a) {...}              // Function 1
int fun(float a, float b) {...}     // Function 2
int fun(float x, int y = 5) {...} // Function 3

int main() {
    float p = 4.5, t = 10.5;
    int s = 30;

    fun(p, s); // CALL - 1
    fun(t);    // CALL - 2
    return 0;
}
```

• CALL - 1: Viable functions: Function 2 & Function 3
• CALL - 1: Matches Function 3
• CALL - 2: Matches Function 1 & Function 3
• CALL - 2: Results in ambiguity

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Overload Resolution with Multiple Arguments

- For overload resolution between functions F1 and F2:

  F1 is better than F2 if, for some argument i, F1 has a better conversion than F2, and for other arguments F1 has a conversion which is not worse than F2.

Example:

```
int fun(int,int,int);        // F1
int fun(double,double,double); // F2
int main() {fun(5,5,2.0);}    // Ambiguous
```

The above is ambiguous because neither F1 nor F2 has a better conversion than the other.

```
int fun(int,int,double);     // F1
int fun(int,double,double);  // F2
int main() {fun(5,5,5);}     // F1 wins
```

F1 is better than F2 in the second argument and not worse in the other two arguments.

Module 08

Sourangshu
Bhattacharya

Objectives &
Outline

Default
Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Program 08.06/07:
Default Parameter & Function Overload

- Compilers deal with default parameters as a special case of function overloading

Default Parameters	Function Overload
| ```
#include <iostream>
using namespace std;
int f(int a = 1, int b = 2);

int main() {
    int x = 5, y = 6;

    f();      // a = 1, b = 2
    f(x);     // a = x = 5, b = 2
    f(x, y); // a = x = 5, b = y = 6

    return 0;
}
``` | ```
#include <iostream>
using namespace std;
int f();
int f(int);
int f(int, int);

int main() {
    int x = 5, y = 6;

    f();      // int f();
    f(x);     // int f(int);
    f(x, y); // int f(int, int);

    return 0;
}
``` |
| • Function f has 2 parameters overloaded
• f can have 3 possible forms of call | • Function f is overloaded with up to 3 parameters
• f can have 3 possible forms of call
• No overload here use default parameters |

Module 08

Parameter

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Program 08.08:
Default Parameter & Function Overload

- Function overloading can use default parameter
- However, with default parameters, the overloaded functions should still be resolvable

```
#include<iostream>
using namespace std;

int Area(int a, int b = 10) { return (a * b); }
double Area(double c, double d) { return (c * d); }

int main() {
    int x = 10, y = 12, t;
    double z = 20.5, u = 5.0, f;

    t = Area(x);    // Binds int Area(int, int = 10)
    cout << "Area = " << t << endl; // t = 100

    f = Area(z, y); // Binds double Area(double, double)
    cout << "Area = " << f << endl;  // f = 102.5

    return 0;
}
```

Function
Overloading

Overload
Resolution

Default
Parameters in
Overloading

Summary

Program 08.09:
Default Parameter & Function Overload

- Function overloading with default parameters may fail

```
#include <iostream>
using namespace std;
int f();
int f(int = 0);
int f(int, int);

int main() {
    int x = 5, y = 6;

    f();    // Error C2668: 'f': ambiguous call to overloaded function
            // More than one instance of overloaded function "f"
            // matches the argument list:
            //     function "f()"
            //     function "f(int = 0)"

    f(x);   // int f(int);
    f(x, y); // int f(int, int);

    return 0;
}
```
