

Equivalence of CFG and PDA

CFG \rightarrow PDA \rightarrow accepts by empty stack

$$(N, \Sigma, P, S) \mapsto (\{*\}, \Sigma, \Gamma, S, \delta, *, \emptyset) = M$$

$$G = \Gamma = N \cup \Sigma$$

$$A \rightarrow \gamma \quad \left((*, \epsilon, A), (*, \gamma) \right) \in \delta$$

$$\forall a \in \Sigma \quad \left((*, a, a), (*, \epsilon) \right) \in \delta$$

$$\mathcal{L}(G) = \mathcal{L}(M) \quad [\text{Exercise: Use induction}]$$

M simulates a leftmost derivation of x in the language.

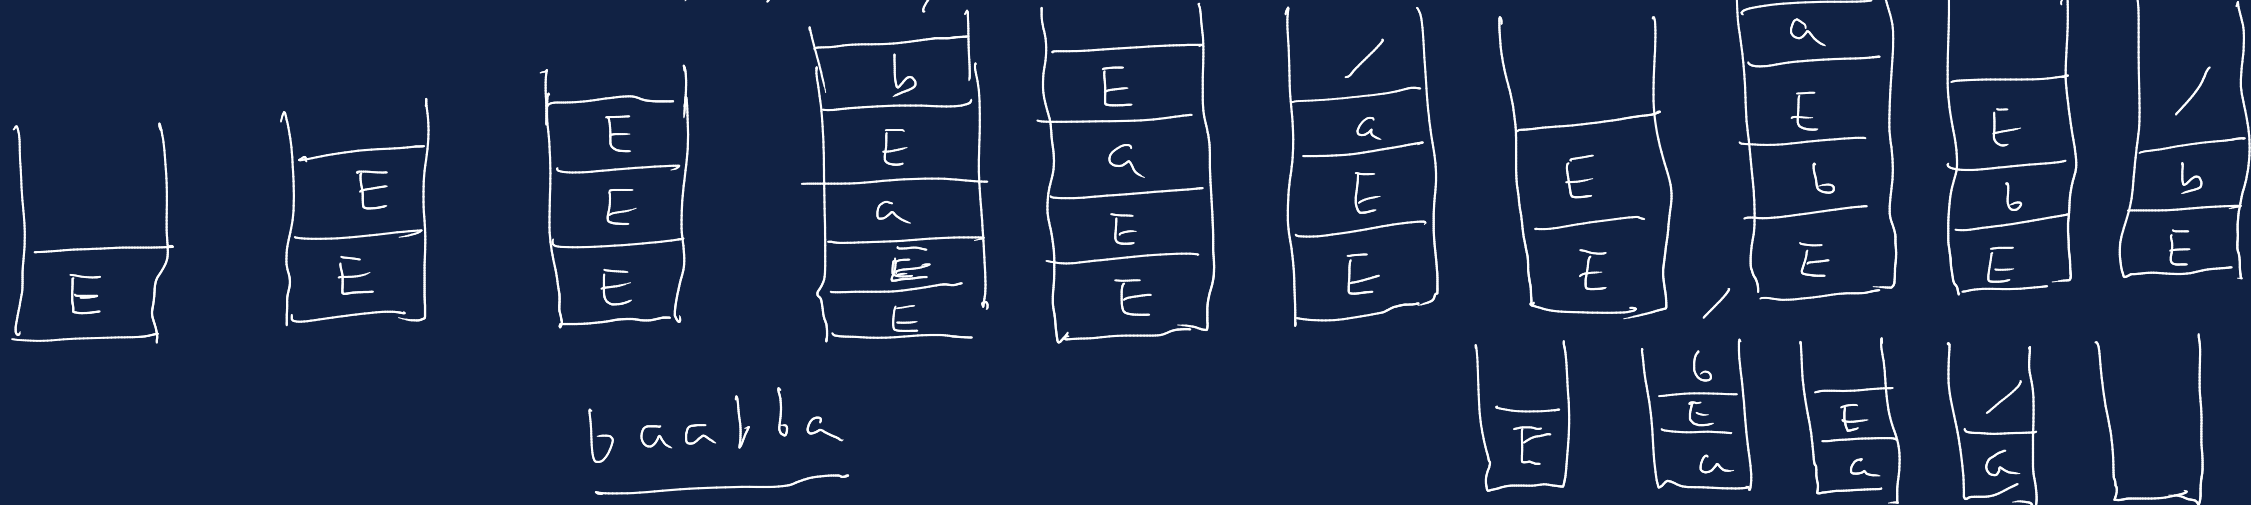

$$E \rightarrow \epsilon \mid aEb \mid bEa \mid EE \quad L = \mathcal{L}(E) = \{ w \in \{a, b\}^* \mid \#a(w) = \#b(w) \}$$

- $\epsilon, \epsilon/\epsilon$
- $\epsilon, \epsilon/aEb$
- $\epsilon, \epsilon/bEa$
- $\epsilon, \epsilon/EE$
- $a, a/\epsilon$
- $b, b/\epsilon$

$$\overbrace{baabba} \in L$$

$$\begin{aligned} E &\rightarrow EE \rightarrow EEE \rightarrow bEaEE \\ &\rightarrow baEE \rightarrow ba\underline{aEbE} \\ &\rightarrow baabE \rightarrow baab\underline{bEa} \rightarrow baabba \end{aligned}$$

PDA \rightarrow CFG

$M \mapsto G$

Two-step process

(1) $M \mapsto M'$ \leftarrow has only one state
accepts by empty stack

(2) $M' \mapsto G$ \leftarrow reverse of the
CFG \rightarrow PDA conversion
process

Step (2) $\left(\left(*, a, A \right), \left(*, \gamma \right) \right) \in \delta$

introduce $A \rightarrow a\gamma$

(straight forward to prove correctness)

Step (1) Is M' general enough?

Yes.

$$M \mapsto M' = (\{\ast\}, \Sigma, \Gamma', \perp', \delta', \ast, \emptyset)$$

$$(Q, \Sigma, \Gamma, \perp, \delta, s, \{t\})$$

accepts by empty stack

↑
only final
state

M' "stores" the state
information of M in
its stack.

M accepts by
both empty stack and final
state

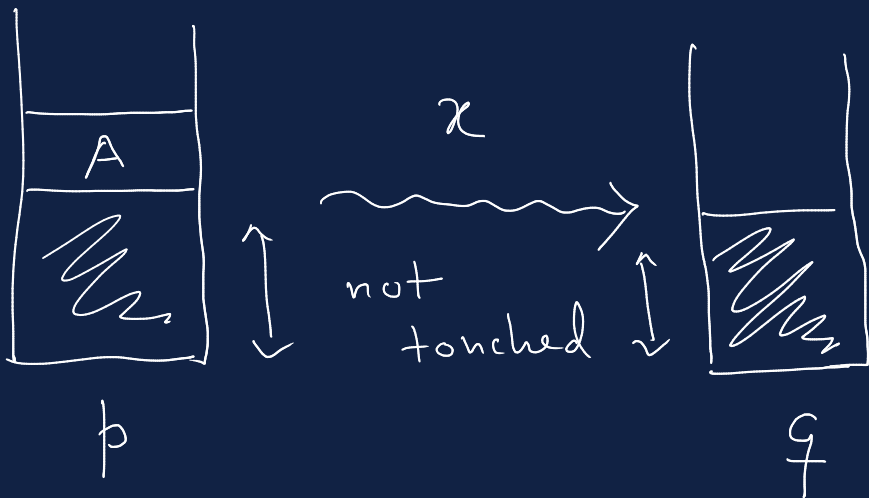

$$\Gamma' = Q \times \Gamma \times Q$$

$$\perp' = \langle s \perp t \rangle$$

$$\langle p, A, q \rangle$$

$$(p, A, q)$$

M

$$\perp' = \langle s \perp t \rangle$$

M'

M

M'

$$M \left((p, a, A), (q_0, B_1 B_2 \dots B_k) \right) \in \mathcal{S}$$

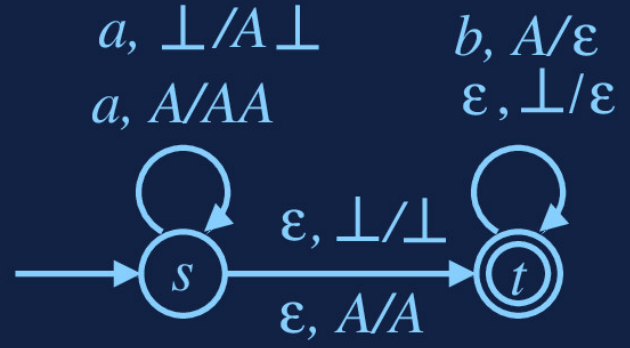

$$a \in \Sigma \cup \{\epsilon\}$$

$$\alpha = a\alpha_1\alpha_2 \dots \alpha_k, \quad M' \text{ guesses } \underline{q_1, q_2, \dots, q_k}$$

$$\left((*, a, \langle p A q_k \rangle), \left(*, \langle q_0 B_1 q_1 \rangle \langle q_1 B_2 q_2 \rangle \dots \langle q_{k-1} B_k q_k \rangle \right) \right)$$

$\{ a^n b^n \mid n \geq 0 \}$

- $((s, a, \perp), (s, A\perp))$
- $((s, a, A), (s, AA))$
- $((s, \varepsilon, \perp), (t, \perp))$
- $((s, \varepsilon, A), (t, A))$
- $((t, b, A), (t, \varepsilon))$
- $((t, \varepsilon, \perp), (t, \varepsilon))$

- $\langle s \perp t \rangle$ \perp_s
- $\langle s A t \rangle$ A_s
- $\langle t \perp t \rangle$ \perp_t
- $\langle t A t \rangle$ A_t

- $((*, a, \langle s \perp t \rangle), (*, \langle s A t \rangle \langle t \perp t \rangle))$
- $((*, a, \langle s A t \rangle), (*, \langle s A t \rangle \langle t A t \rangle))$
- $((*, \varepsilon, \langle s \perp t \rangle), (*, \langle t \perp t \rangle))$
- $((*, \varepsilon, \langle s A t \rangle), (*, \langle t A t \rangle))$
- $((*, b, \langle t A t \rangle), (*, \varepsilon))$
- $((*, \varepsilon, \langle t \perp t \rangle), (*, \varepsilon))$

unless $\left\{ \begin{array}{l} \langle s A s \rangle \quad \langle s \perp s \rangle \\ \langle t A s \rangle \quad \langle t \perp s \rangle \end{array} \right.$

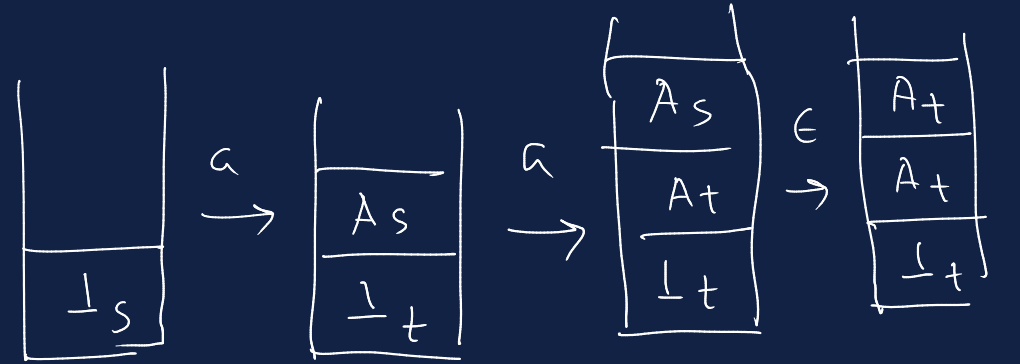

$\langle s \perp t \rangle$

$$\Gamma = \{ \perp_s, \perp_t, A_s, A_t \}$$

//
aabb

- a, $\perp_s / A_s \perp_t$
- a, $A_s / A_s A_t$
- ϵ , \perp_s / \perp_t
- ϵ , A_s / A_t
- b, A_t / ϵ
- ϵ , \perp_t / ϵ

Formal proof

$$\mathcal{L}(M') = \mathcal{L}(M)$$

Induction
