

# Three Address Code Generation

How to store?

How to represent?

## **Directed Acyclic Graphs for Expressions (DAG) :**

Like the syntax tree for an expression, a DAG has leaves corresponding to operands and interior codes corresponding to operators. The difference is that a node N in a DAG has more than one parent if N represents a common subexpression; in a syntax tree, the tree for the common subexpression would be replicated as many times as the subexpression appears in the original expression.

Dag for the expression  $a + a * (b - c) + (b - c) * d$

## Representations of 3 address code

Three representations are called "quadruples," triples," and "indirect triples."

### 1. Quadrapules

A quadruple has four fields, which we call op, arg,, arg2, and result. The op field contains an internal code for the operator. For instance, the three-address instruction  $x = y + x$  is represented by placing + in op, y in op1, z in op2 and x in result

```

t1 = minus c
t2 = b * t1
t3 = minus c
t4 = b * t3
t5 = t2 + t4
a = t5
    
```

(a) Three-address code

	<i>op</i>	<i>arg<sub>1</sub></i>	<i>arg<sub>2</sub></i>	<i>result</i>
0	minus	c		t <sub>1</sub>
1	*	b	t <sub>1</sub>	t <sub>2</sub>
2	minus	c		t <sub>3</sub>
3	*	b	t <sub>3</sub>	t <sub>4</sub>
4	+	t <sub>2</sub>	t <sub>4</sub>	t <sub>5</sub>
5	=	t <sub>5</sub>		a
		...		

(b) Quadruples

### 2. Triples

A triple has only three fields, which we call op, op1, and op2.

(a) Syntax tree

	<i>op</i>	<i>arg<sub>1</sub></i>	<i>arg<sub>2</sub></i>
0	minus	c	
1	*	b	(0)
2	minus	c	
3	*	b	(2)
4	+	(1)	(3)
5	=	a	(4)
		...	

(b) Triples

### 3. Indirect Triples

Indirect triples consist of a listing of pointers to triples, rather than a listing of triples themselves

## Common Three-Address Instruction Forms

### 1. Assignment

$$x = y \text{ op } z$$

where op is a binary arithmetic or logical operation, and x, y, and z are addresses.

$$x = \text{op } y$$

where op is a unary operation.

### 2. Copy

$$x = y$$

where x is assigned the value of y.

### 3. Unconditional jump

$$\text{goto } L$$

where the three-address instruction with label L is the next to be executed.

### 5. Conditional jumps

$$\text{if } x \text{ goto } L$$

These instructions execute the instruction with label L next if x is true

$$\text{if } x \text{ reop } y \text{ goto } L$$

which apply a relational operator to x and y

### 6. Procedure calls

$$\begin{aligned} &\text{call } p \\ &\text{return } y \end{aligned}$$

### 7. Indexed copy instructions

$$\begin{aligned} x &= y[i] \\ x[i] &= y \end{aligned}$$

### 8. Address and pointer assignments

$$\begin{aligned} x &= \&y \\ x &= *y \\ *x &= y \end{aligned}$$
