

Wi-Fi Direct: Wi-Fi P2P Connection

A decorative graphic consisting of a solid teal horizontal bar at the top, followed by a white horizontal bar, and then three thin, parallel teal horizontal lines on the right side of the white bar.

INTRODUCTION

- Wi-Fi direct is new technology
 - enhancing direct device to device communication without requiring a wireless access point.

- Wi-Fi direct builds upon the successful IEEE 802.11 infrastructure mode
 - lets devices negotiate who will take over the AP-like functionalities.

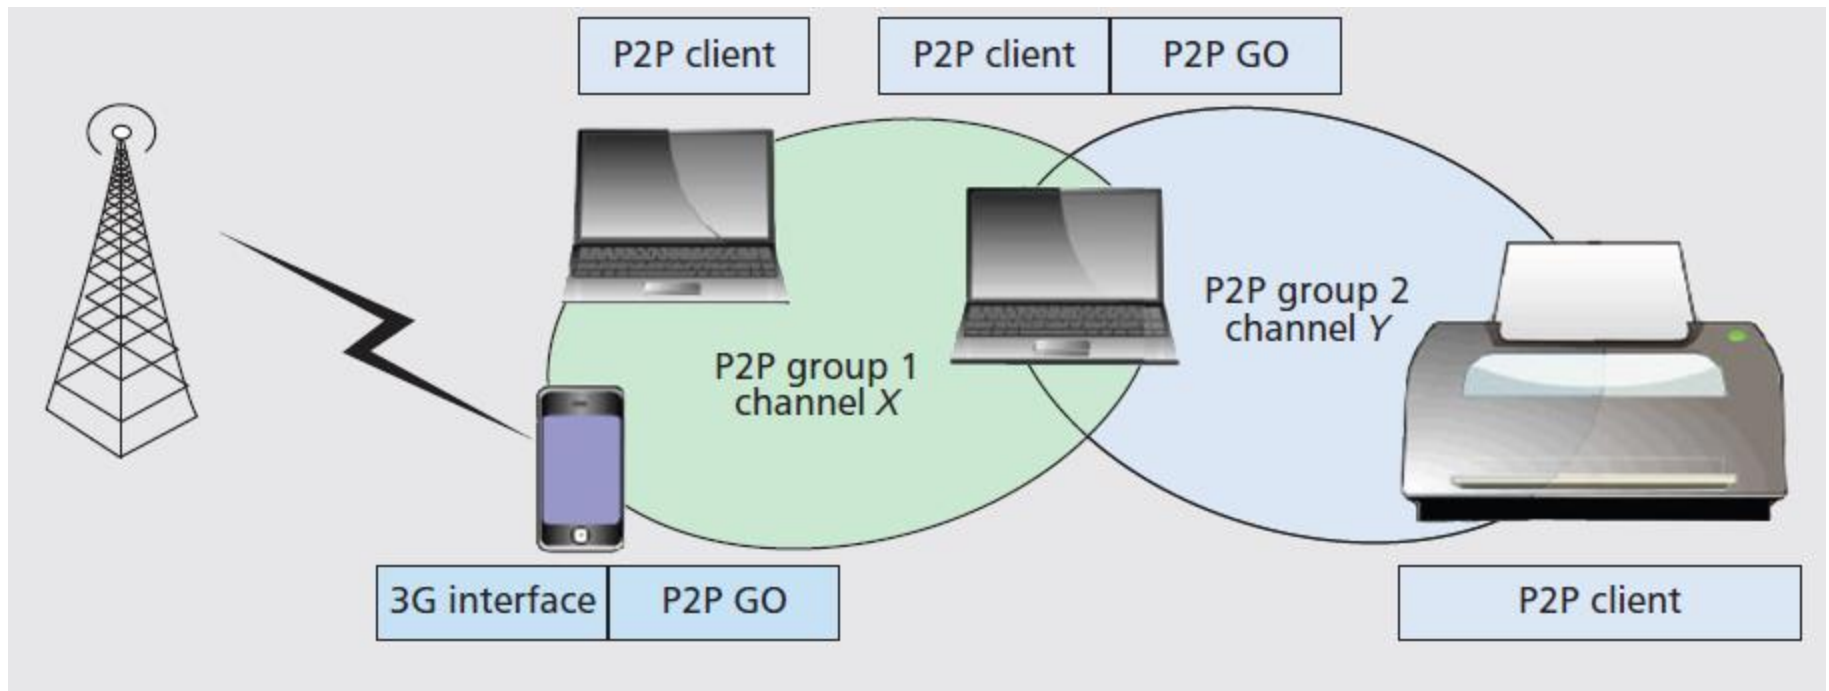

TECHNICAL OVERVIEW

- In a typical Wi-Fi network, client scans and associate to wireless networks available, which are created and announced by Access Points (AP).
- Wi-Fi Direct is that these roles are specified as dynamic,
 - hence a Wi-Fi Direct device has to implement both the role of a client and the role of an AP.
- These roles are therefore logical roles that could even be executed simultaneously by the same device, this type of operation is called Concurrent mode.

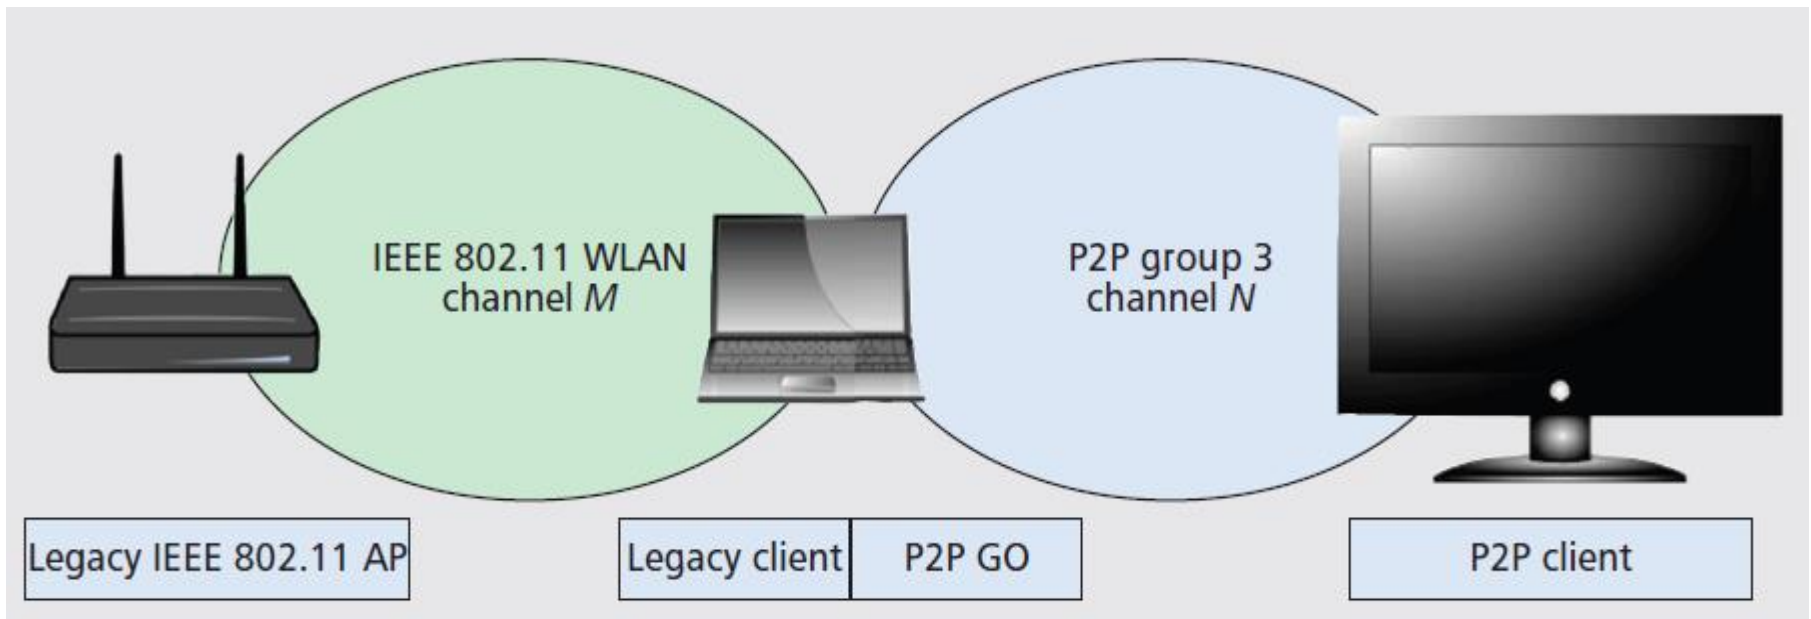

ARCHITECTURE

- Wi-Fi direct device communicate by establishing P2P group.
- The device implementing AP-like functionality in P2P group is referred to as the **P2P Group Owner(P2P GO)**, and device acting as client are known as **P2P clients**.
- Once P2P group is established, other P2P clients can join the group as in a traditional Wi-Fi network.
- When the device act as both as P2P client and as P2P GO
 - **the device will typically alternate between the two roles by time-sharing the Wi-Fi interface**
- Like a traditional AP, a P2P GO announces itself through beacons, and has to support power saving for its associated clients.

Wi-Fi Direct Setup: Scenario 1

Wi-Fi Direct Setup: Scenario 2

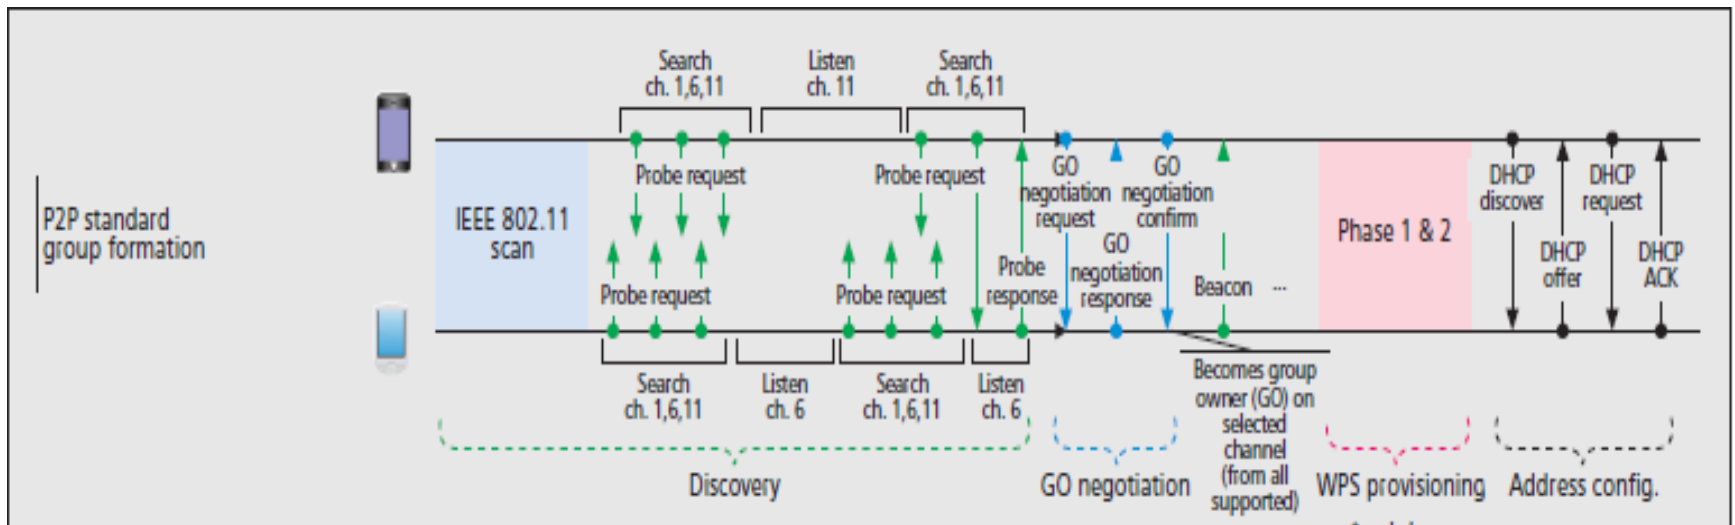

- Only the **P2P GO** is allowed to cross-connect the devices in its P2P group to an external network.
- Wi-Fi direct does not allow transferring the role of P2P GO within the group.
- If P2P GO leaves the P2P group then the group is break down, and has to re-established.

GROUP FORMATION

- Three types of group formation techniques
 - Standard
 - Autonomous
 - Persistent
- Group Formation procedure involves two phases-
 - **Determination of P2P Group owner**
 - Negotiated - Two P2P devices negotiate for P2P group owner based on desire/capabilities to be a P2P GO.
 - Selected - P2P group Owner role established at formation or at an application level
 - **Provisioning of P2P Group**
 - Establishment of P2P group session using appropriate credentials
 - Using Wi-Fi simple configuration to exchange credentials.

GROUP FORMATION: Standard

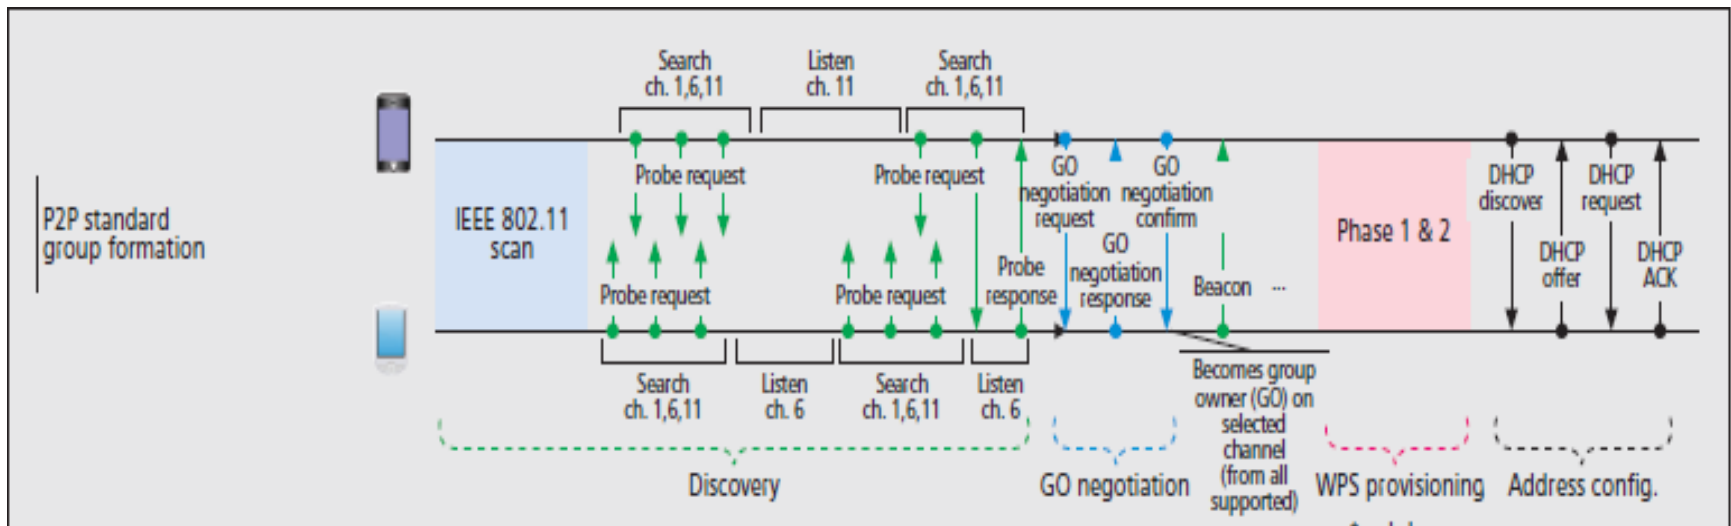

- In this case the P2P devices have to discover each other, and then negotiate which device will act as P2P GO.
- It starts by performing a traditional Wi-Fi scan, by means of which they can discover existent groups and Wi-Fi networks.

- To prevent conflicts when two devices declare the same GO Intent, a tie-breaker bit is included in the GO Negotiation Request, which is randomly set every time a GO Negotiation Request is sent.

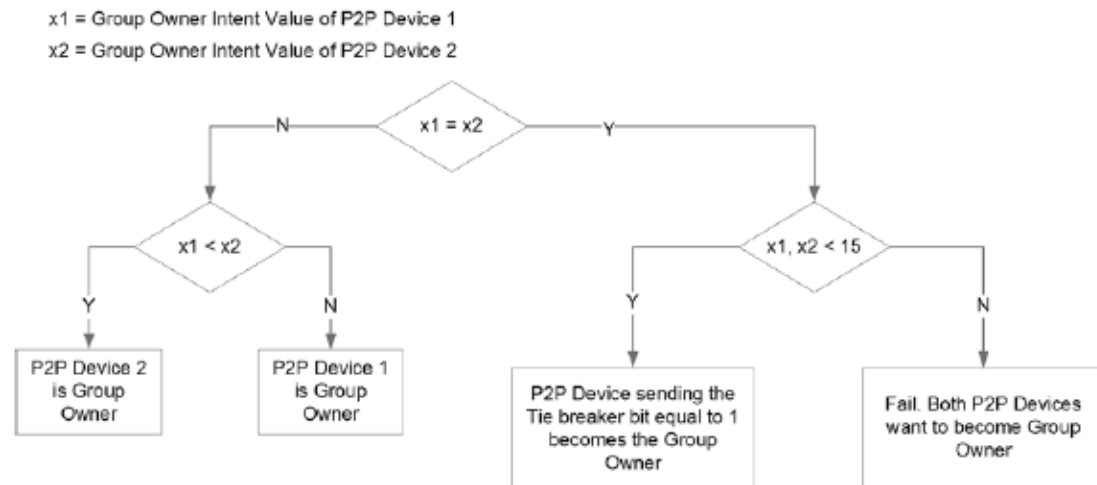

GROUP FORMATION: Standard

- Discovery algorithm: P2p device selects one of the social channels (2.4 GHz– ch-1, 6, 11)
- Two state – (a) search – sends Probe request
 -
- (b) listen----listens for probe request ---- sends Probe response
- Each state ----- 100 ms to 300 ms
 - **Tradeoff (discovery time with throughput, energy)**

GROUP FORMATION: Standard

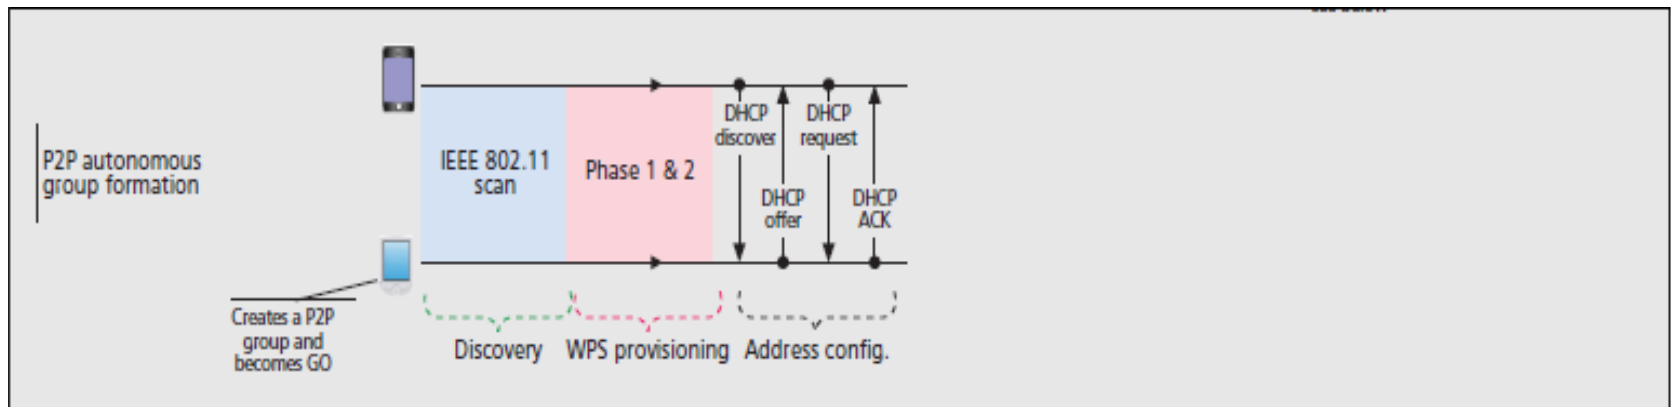

- Select GO----GO negotiation phase
- Three way handshake (request/response/confirmation)
- Selects GO and channel (2.4Ghz, 5Ghz)
- P2p device sends a numerical value --- GO Intent
 - Highest value

- To prevent conflicts when two devices declare the same GO Intent, a **tie-breaker bit** is included in the GO Negotiation Request,
- Randomly set every time a GO Negotiation Request is sent.

GROUP FORMATION: Autonomous

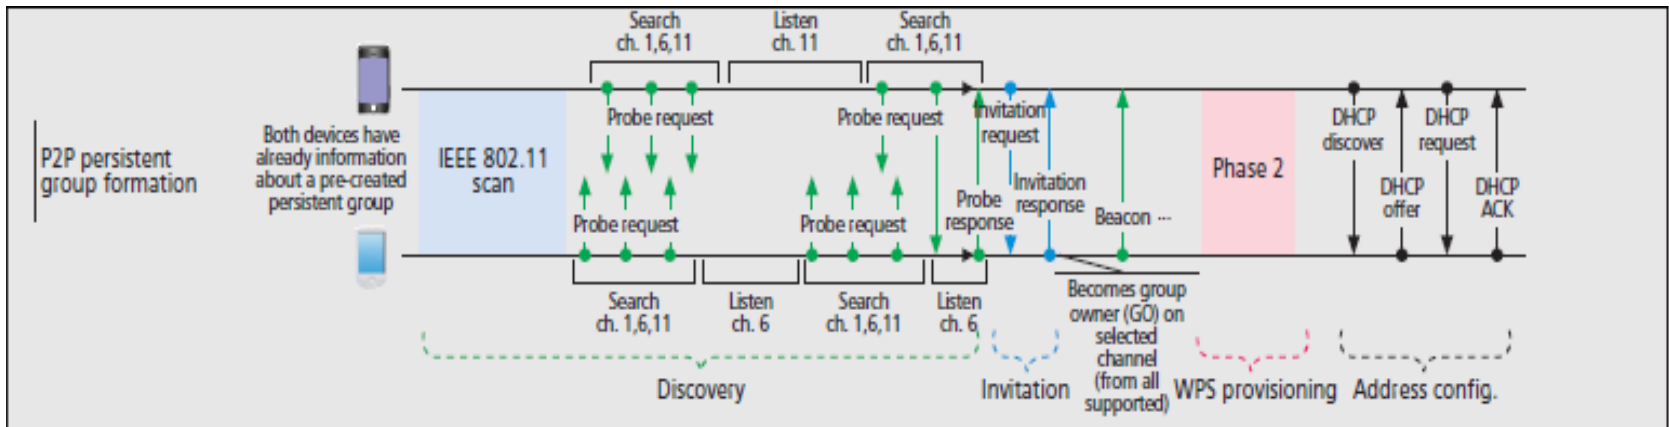

- A P2P device may **autonomously** create a P2P group,
 - it immediately becomes the P2P GO, by sitting on a channel and starting a beacon.

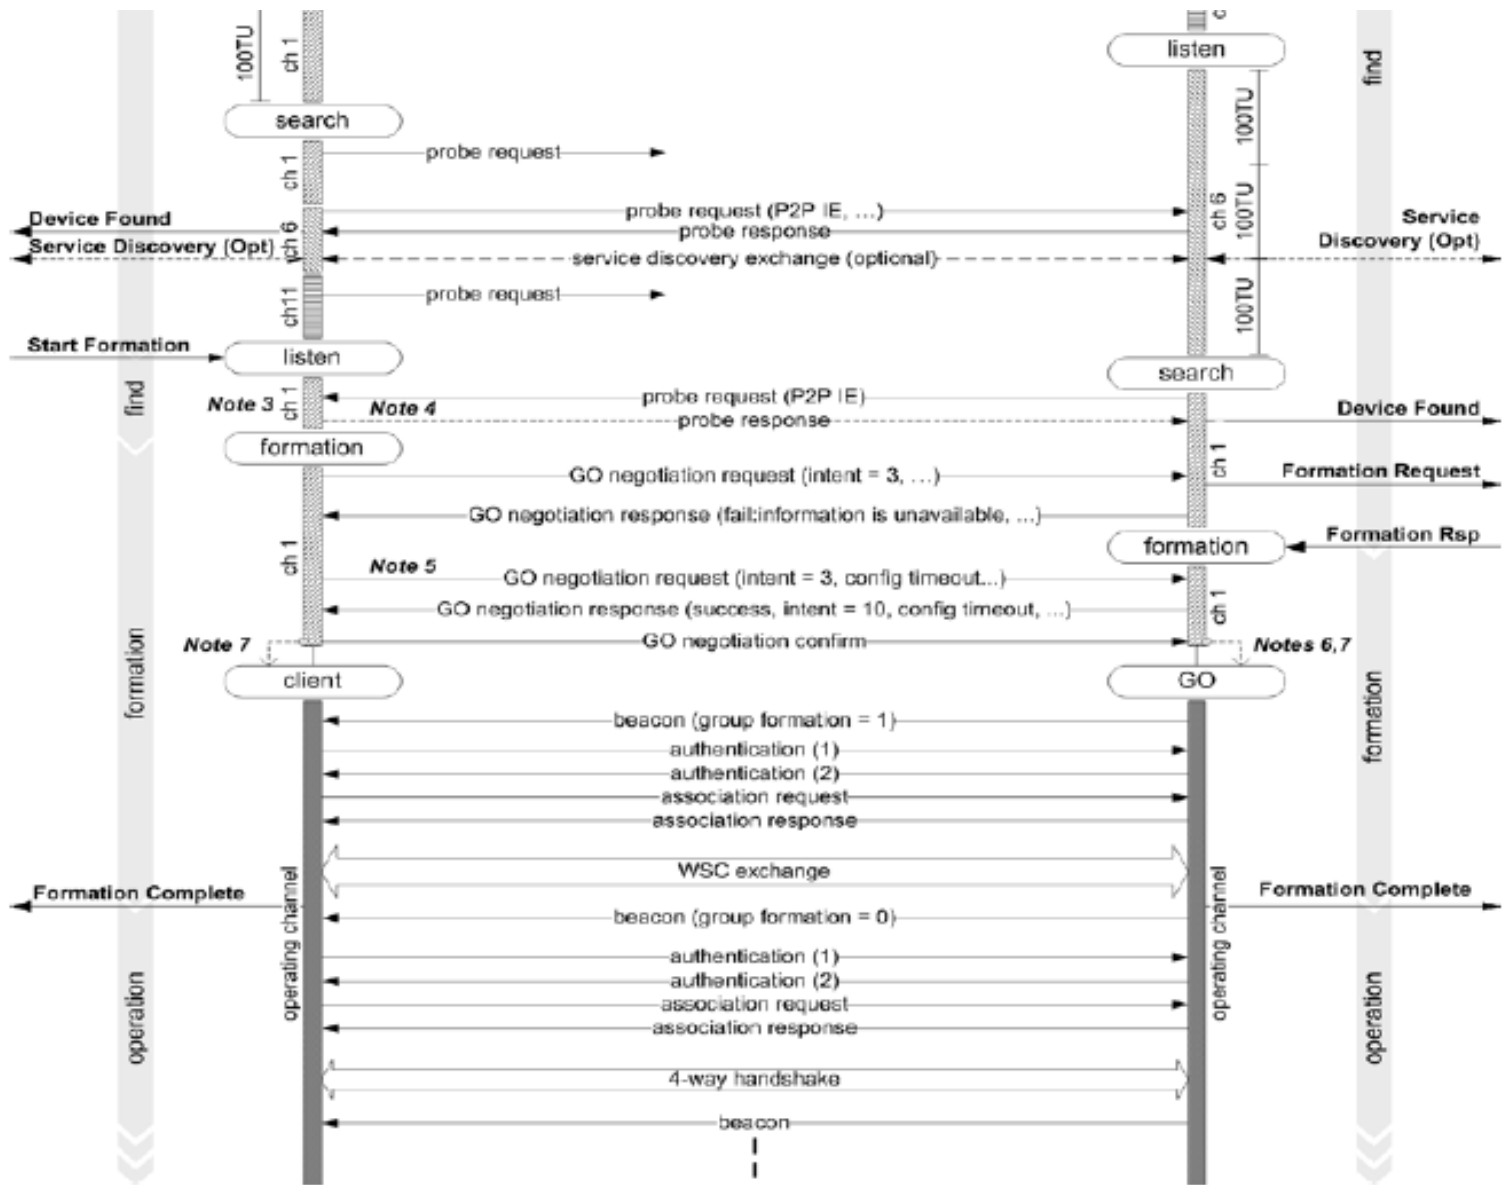

- Other devices can discover the established group using traditional scanning mechanisms.
- As compared to previous case, the discovery phase is simplified
 - the device establishing the group does not alternate between states, and indeed no GO negotiation phase is required.

GROUP FORMATION: Persistent

- In this process, P2P device can declare a group as persistent, by using flag in the P2P capabilities attribute present in beacon frames.

- After the discovery phase, if a P2P device recognizes to have formed a persistent group with the corresponding peer in the past, any of the two P2P devices can use the Invitation Procedure to quickly re-instantiate the group.

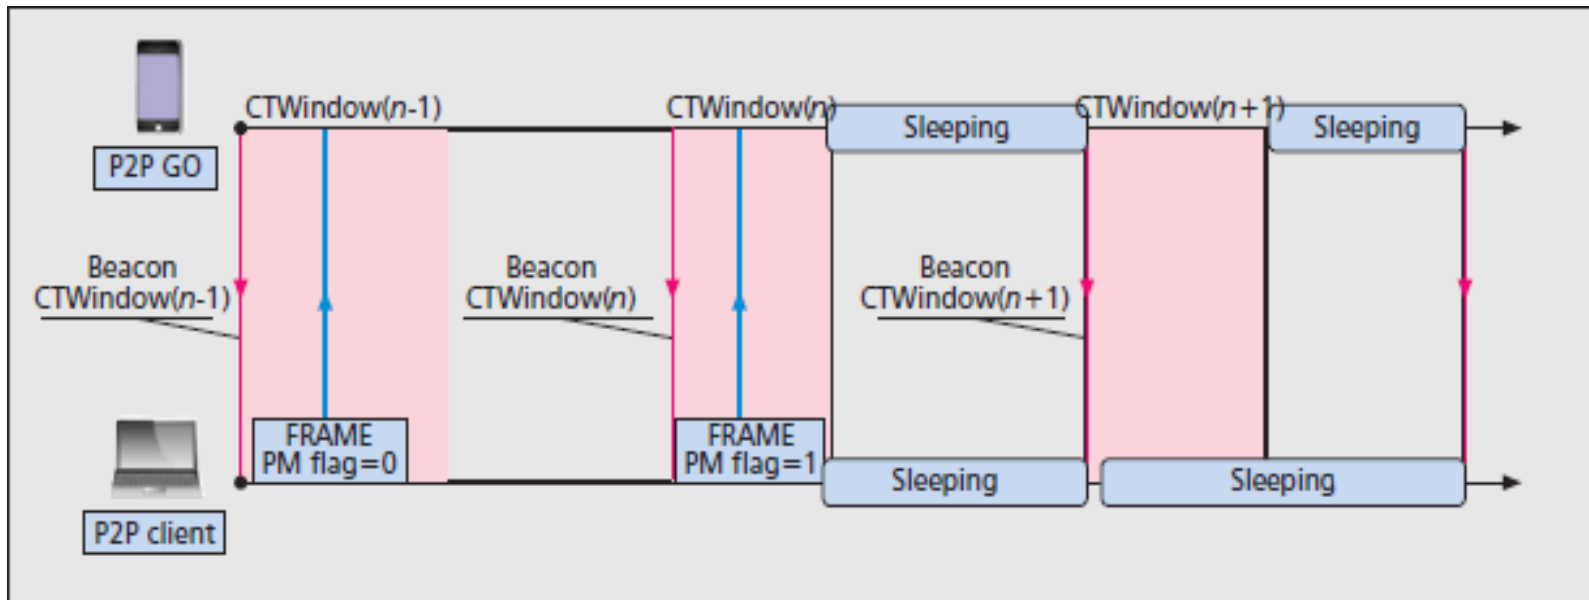

POWER SAVING

- Wifi provides power saving of p2p clients
 - Power management bit
 - Client goes to sleep
 - No option for power saving for AP
- Wi-Fi Direct defines two new power saving mechanisms:
 - Opportunistic Power Save
 - Notice of Absence

POWER SAVING: Opportunistic Power Save

- P2p clients can move to sleep state
- Allows a P2P GO to save power when all its associated clients are sleeping.
- The P2P Group Owner can only save power when all its clients are sleeping.

Opportunistic power save

POWER SAVING: Opportunistic Power Save

Target Beacon Transmission Time

Traffic indicator map

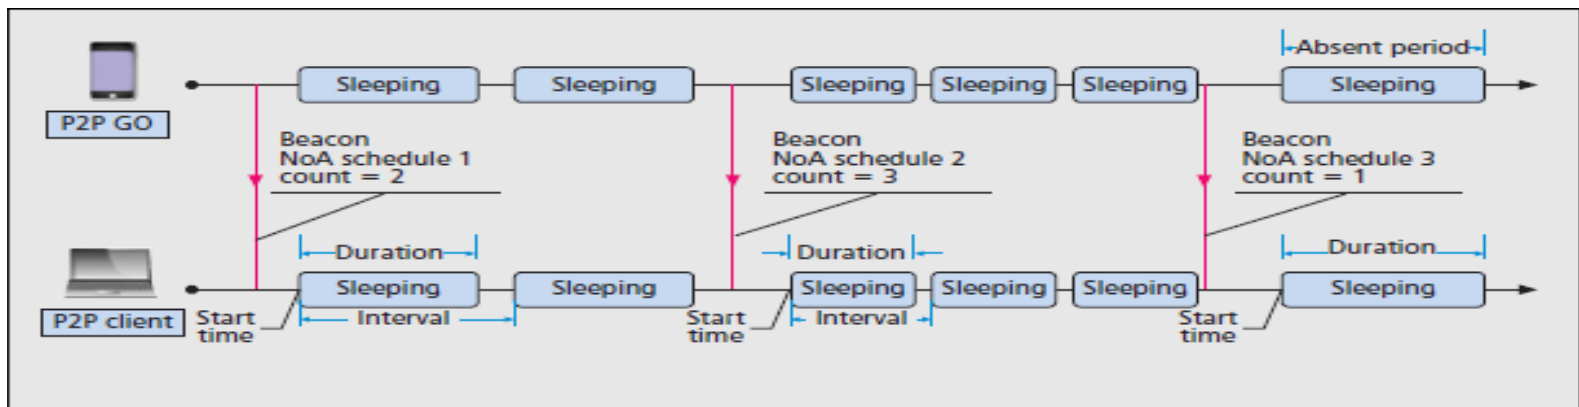

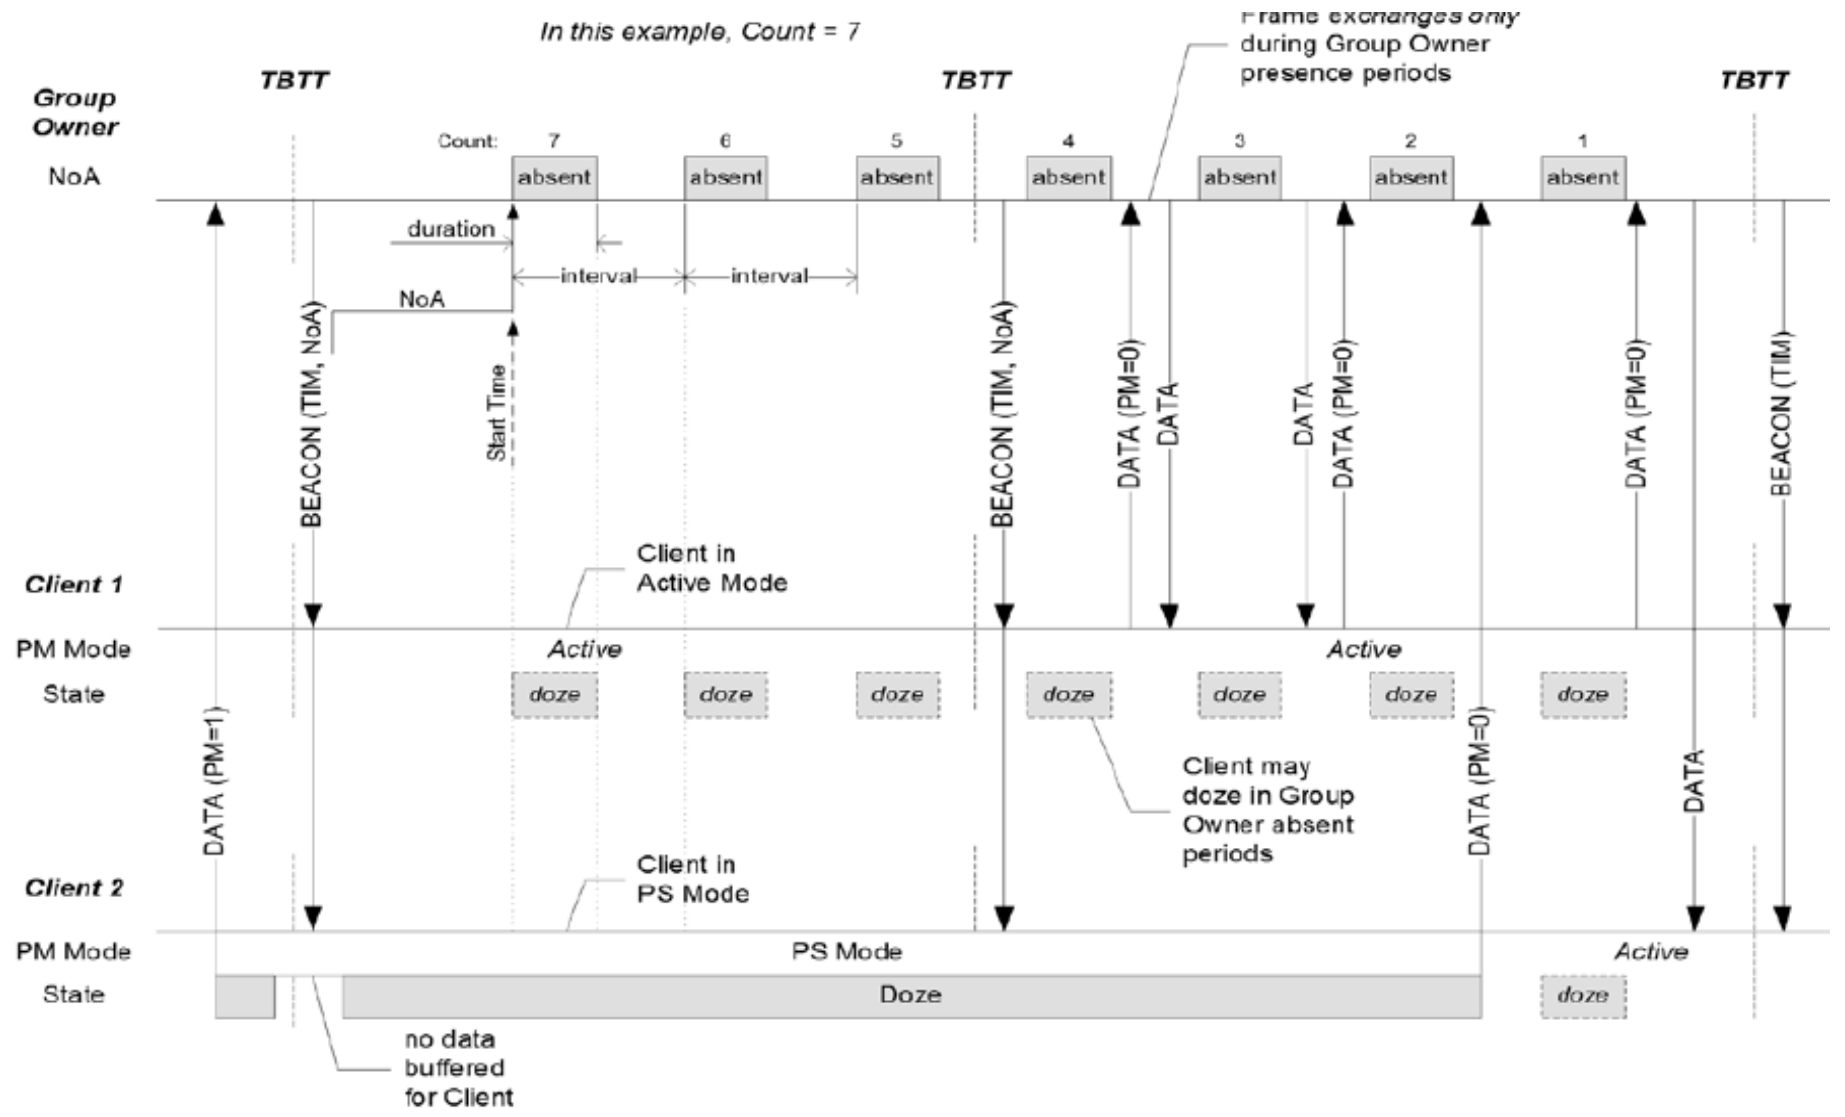

Fig.5. Opportunistic Powersave Operation

POWER SAVING: Notice of Absence

- This protocol (NoA) allows a P2P GO to announce time intervals, referred to as absence periods, where P2P Clients are not allowed to access the channel.---Beacons, probe response
- P2P GO defines a NoA schedule using four parameters:
 - Duration that specifies the length of each absence period
 - Interval that specifies the time between consecutive absence periods
 - Time that specifies the start time of the first absence period after the current Beacon frame
 - Count that specifies how many absence periods will be scheduled during the current NoA schedule.

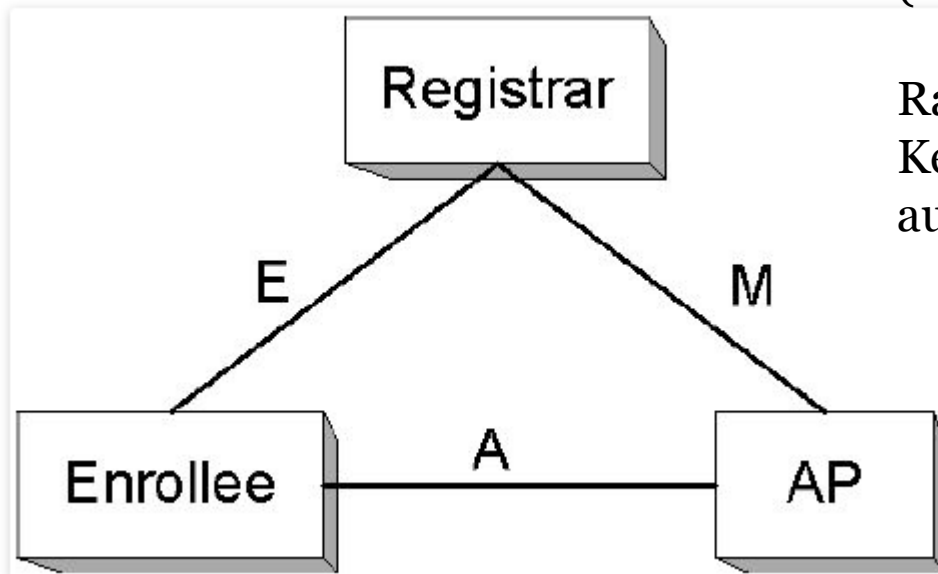

Notice of Absence

SECURITY

- Wi-Fi Direct devices are required to implement **Wi-Fi Protected Setup (WPS)** to support a secure connection with minimal user intervention.
- WPS allows establishing a secure connection by introducing a **PIN in the P2P Client**, or **pushing a button** in the two P2P Devices.
- Following WPS terminology, the P2P GO is required to implement an internal **Registrar**, and the P2P Client is required to implement an **Enrollee**.
- The operation of WPS is composed of two parts.
- **In the first part**, the internal Registrar is in charge of generating and issuing the network credentials, i.e., security keys, to the Enrollee
- **In the second part**, the Enrollee (P2P Client) disassociates and reconnects using its new authentication credentials.

Advanced Encryption Standard (AES)-CCMP as cipher,

Randomly generated Pre-Shared Key (PSK) for mutual authentication

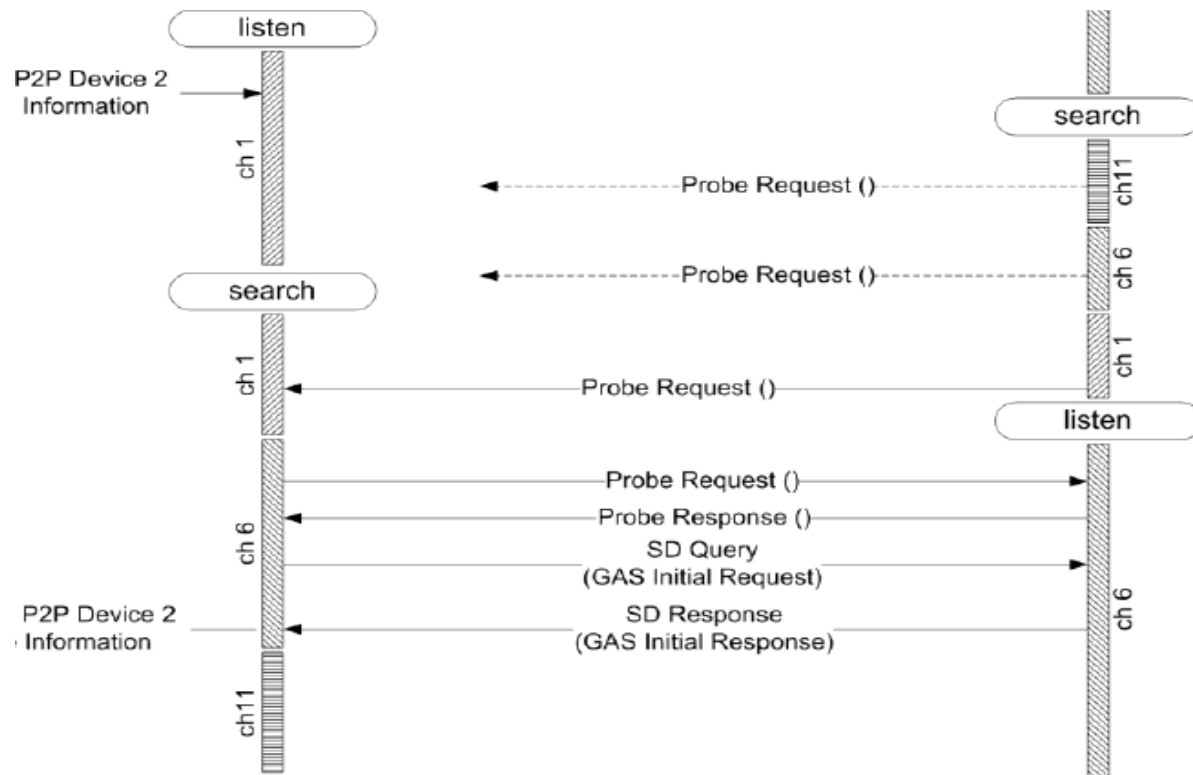

Service discovery protocol

Generic Advertisement Service (GAS) protocol

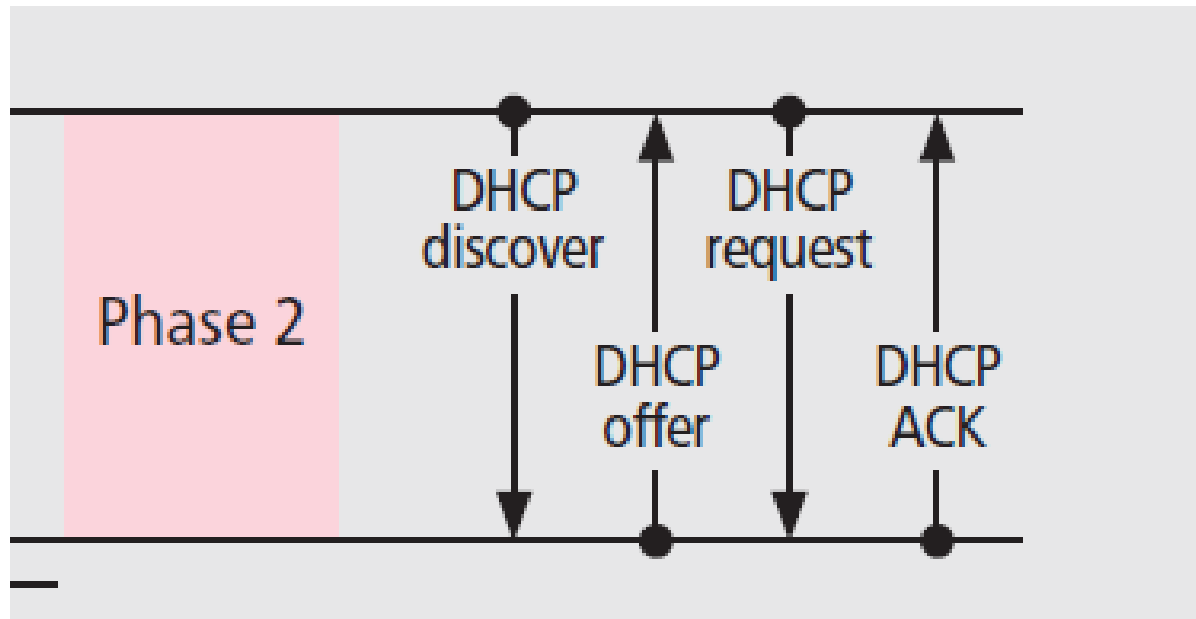

- It may be a single or multiple GAS Initial Request and Response action frame exchange.
- The requesting P2P Device transmits one or more GAS Initial Request frames.
- A target P2P Device that supports Service Discovery responds with one or more GAS Initial Response frames.
- The Service Discovery procedure can be used to find:
 - A list of all services offered by a P2P Device
 - Information about a single service offered by a P2P Device
 - Information about multiple services offered by a P2P Device
 - If there has been a change in the services offered by a P2P Device

Generic Advertisement Service (GAS) protocol

Address configuration

CONCLUSIONS

- Wi-Fi alliance has recently developed the Wi-Fi Direct technology that builds upon the Wi-Fi infrastructure mode to enable direct device to device connectivity.
- Thorough overview of the novel technical features specified in Wi-Fi Direct, following by the group formation, and other performance analysis such as power saving and security in this device.
- The NoA protocol could also be re-used to virtualizes the roles of P2P GO/Client over multiple concurrent P2P Groups.
- Concurrent operation together with dynamic nature of the P2P GO/Client roles could be used to improve performance in dense environments, for instance by means of dynamic relays.
