Program 13.01/02: Stack: Initialization

Module 13

Instructors: Abir Das and Sourangshu Bhattacharya

Objectives & Outline

Constructor

Contrasting with Member Functions

Parameterized

Default Parameters

Overloaded

Destructor

Contrasting with Member Functions

Default Constructor

Object Lifetime

Automatic

Static

Dynamic

Module Summary

Public Data

```
#include <iostream>
using namespace std;
class Stack { public: // VULNERABLE DATA
    char data_[10]; int top_;
public:
    int empty() { return (top_ == -1); }
    void push(char x) { data_[++top_] = x; }
    void pop() { --top_; }
    char top() { return data_[top_]; }
};
int main() { char str[10] = "ABCDE";
    Stack s; s.top_ = -1; // Exposed initialization

    for (int i = 0; i < 5; ++i) s.push(str[i]);
    // s.top_ = 2; // RISK - CORRUPTS STACK
    while (!s.empty()) { cout << s.top(); s.pop(); }
}
```

- Spills data structure codes into application
- public data reveals the *internals*
- To switch container, application needs to change
- Application may corrupt the stack!

Private Data

```
#include <iostream>
using namespace std;
class Stack { private: // PROTECTED DATA
    char data_[10]; int top_;
public:
    void init() { top_ = -1; }
    int empty() { return (top_ == -1); }
    void push(char x) { data_[++top_] = x; }
    void pop() { --top_; }
    char top() { return data_[top_]; }
};
int main() { char str[10] = "ABCDE";
    Stack s; s.init(); // Clean initialization

    for (int i = 0; i < 5; ++i) s.push(str[i]);
    // s.top_ = 2; // Compile error - SAFE
    while (!s.empty()) { cout << s.top(); s.pop(); }
}
```

- No code in application, but `init()` to be called
- private data protects the *internals*
- Switching container is seamless
- Application cannot corrupt the stack

Program 13.02/03: Stack: Initialization

Module 13

Instructors: Abir Das and Sourangshu Bhattacharya

Objectives & Outline

Constructor

Contrasting with Member Functions

Parameterized

Default Parameters

Overloaded

Destructor

Contrasting with Member Functions

Default Constructor

Object Lifetime

Automatic

Static

Dynamic

Module Summary

Using init()

```
#include <iostream>
using namespace std;
class Stack { private: // PROTECTED DATA
    char data_[10]; int top_;
public: void init() { top_ = -1; }
    int empty() { return (top_ == -1); }
    void push(char x) { data_[++top_] = x; }
    void pop() { --top_; }
    char top() { return data_[top_]; }
};
int main() { char str[10] = "ABCDE";
    Stack s; s.init(); // Clean initialization

    for (int i = 0; i < 5; ++i) s.push(str[i]);
    // s.top_ = 2; // Compile error - SAFE
    while(!s.empty()) { cout << s.top(); s.pop(); }
}
```

- **init() serves no visible purpose – application may forget to call**
- **If application misses to call init(), we have a corrupt stack**

Using Constructor

```
#include <iostream>
using namespace std;
class Stack { private: // PROTECTED DATA
    char data_[10]; int top_;
public: Stack() : top_(-1) { } // Initialization
    int empty() { return (top_ == -1); }
    void push(char x) { data_[++top_] = x; }
    void pop() { --top_; }
    char top() { return data_[top_]; }
};
int main() { char str[10] = "ABCDE";
    Stack s; // Init by Stack::Stack() call

    for (int i = 0; i < 5; ++i) s.push(str[i]);

    while(!s.empty()) { cout << s.top(); s.pop(); }
}
```

- **Can initialization be made a part of instantiation?**
- **Yes. Constructor is implicitly called at instantiation as set by the compiler**

Program 13.04/05: Stack: Constructor

Module 13

Instructors: Abir Das and Sourangshu Bhattacharya

Objectives & Outline

Constructor

Contrasting with Member Functions

Parameterized

Default Parameters

Overloaded

Destructor

Contrasting with Member Functions

Default

Constructor

Object Lifetime

Automatic

Static

Dynamic

Module Summary

Automatic Array

```
#include <iostream>
using namespace std;
class Stack { private:
    char data_[10]; int top_; // Automatic
public: Stack(); // Constructor
    // More Stack methods
};
Stack::Stack(): // Initialization List
    top_(-1) { cout << "Stack::Stack()" << endl;
}
int main() { char str[10] = "ABCDE";
    Stack s; // Init by Stack::Stack() call
    for (int i=0; i<5; ++i) s.push(str[i]);
    while(!s.empty()) { cout << s.top(); s.pop(); }
}
-----
Stack::Stack()
EDCBA
```

- `top_` initialized to `-1` in initialization list
- `data_[10]` initialized by default (*automatic*)
- `Stack::Stack()` called *automatically* when control passes `Stack s`; – Guarantees initialization

Dynamic Array

```
#include <iostream>
using namespace std;
class Stack { private:
    char *data_; int top_; // Dynamic
public: Stack(); // Constructor
    // More Stack methods
};
Stack::Stack(): data_(new char[10]), // Init List
    top_(-1) { cout << "Stack::Stack()" << endl;
}
int main() { char str[10] = "ABCDE";
    Stack s; // Init by Stack::Stack() call
    for (int i=0; i<5; ++i) s.push(str[i]);
    while(!s.empty()) { cout << s.top(); s.pop(); }
}
-----
Stack::Stack()
EDCBA
```

- `top_` initialized to `-1` in initialization list
- `data_` initialized to `new char[10]` in init list

Constructor: Contrasting with Member Functions

Module 13

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outline

Constructor

Contrasting with
Member Functions

Parameterized

Default Parameters

Overloaded

Destructor

Contrasting with
Member Functions

Default
Constructor

Object Lifetime

Automatic

Static

Dynamic

Module Summary

Constructor

- Is a static member function without **this** pointer – but gets the pointer to the memory where the object is constructed
- Name is same as the name of the class

```
class Stack { public: Stack(); };
```

- Has no return type - not even **void**
- Does not return anything. Has no **return** statement

```
Stack::Stack(); // Not even void
```

```
Stack::Stack(): top_(-1)  
{ } // Returns implicitly
```

- Initializer list to initialize the data members
- Implicit call by instantiation / **operator new**
- May be **public** or **private**
- May have any number of parameters
- Can be overloaded

```
Stack::Stack(): // Initializer list  
    data_(new char[10]), // Init data_  
    top_(-1) // Init top_  
{ }
```

```
Stack s; // Calls Stack::Stack()
```

Member Function

- Has implicit **this** pointer
- Any name different from name of class
- Must have a return type - may be **void**
- Must have at least one **return** statement
- Not applicable
- Explicit call by the object
- May be **public** or **private**
- May have any number of parameters
- Can be overloaded

```
class Stack { public: int empty(); };
```

```
int Stack::empty();
```

```
int Stack::empty() { return (top_ == -1); }  
void pop()  
{ --top_; } // Implicit return for void
```

```
s.empty(); // Calls Stack::empty(&s)
```

Module Summary

Resource Release by User

```
#include <iostream>
using namespace std;
class Stack { char *data_; int top_; // Dynamic
public: Stack(): data_(new char[10]), top_(-1)
    { cout << "Stack() called\n"; } // Constructor
    void de_init() { delete [] data_; }

    // More Stack methods
};
int main() { char str[10] = "ABCDE";
    Stack s; // Init by Stack::Stack() call
    // Reverse string using Stack
    s.de_init();
}
-----
Stack() called
EDCBA
```

- **data_ leaks unless released within the scope of s**
- **When to call de_init()? User may forget to call**

Automatic Resource Release

```
#include <iostream>
using namespace std;
class Stack { char *data_; int top_; // Dynamic
public: Stack(): data_(new char[10]), top_(-1)
    { cout << "Stack() called\n"; } // Constructor
    ~Stack() { cout << "\n~Stack() called\n";
        delete [] data_; // Destructor
    }
    // More Stack methods
};
int main() { char str[10] = "ABCDE";
    Stack s; // Init by Stack::Stack() call
    // Reverse string using Stack
} // De-Init by automatic Stack::~Stack() call
-----
Stack() called
EDCBA
~Stack() called
```

- **Can de-initialization be a part of scope rules?**
- **Yes. Destructor is implicitly called at end of scope**

Destructor: Contrasting with Member Functions

Instructors: Abir Das and Sourangshu Bhattacharya

Objectives & Outline

Constructor

Contrasting with Member Functions

Parameterized

Default Parameters

Overloaded

Destructor

Contrasting with Member Functions

Default Constructor

Object Lifetime

Automatic

Static

Dynamic

Module Summary

Destructor

- Has implicit **this** pointer
- Name is `~` followed by the name of the class

```
class Stack { public:
    ~Stack();
};
```
- Has no return type - not even **void**

```
Stack::~Stack(); // Not even void
```
- Does not return anything. Has no **return** statement

```
Stack::~Stack()
{ } // Returns implicitly
```
- Implicitly called at end of scope
- May be **public** or **private**
- No parameter is allowed - unique for the class
- Cannot be overloaded

Member Function

- Has implicit **this** pointer
- Any name different from name of class

```
class Stack { public:
    int empty();
};
```
- Must have a return type - may be **void**

```
int Stack::empty();
```
- Must have at least one **return** statement

```
int Stack::empty()
{ return (top_ == -1); }
```
- Explicit call by the object

```
s.empty(); // Calls Stack::empty(&s)
```
- May be **public** or **private**
- May have any number of parameters
- Can be overloaded

Module Summary

- **Constructor**

- A constructor with no parameter is called a *Default Constructor*
- If no constructor is provided by the user, the compiler supplies a *free* default constructor
- Compiler-provided (*free default*) constructor, understandably, cannot initialize the object to proper values. It has no code in its body

- **Destructor**

- If no destructor is provided by the user, the compiler supplies a *free* default destructor
- Compiler-provided (*free default*) destructor has no code in its body

Program 13.13: Complex: Default Constructor: User Defined

Constructor

Object Lifetime

Automatic

Static

Dynamic

Module Summary

- In OOP, the **object lifetime** (or **life cycle**) of an object is the time between an *object's creation* and its *destruction*
- Rules for object lifetime vary significantly:
 - *Between languages*
 - in some cases *between implementations* of a given language, and
 - lifetime of a particular object may vary *from one run of the program to another*
- **Context C++:** *Object Lifetime* coincides with **Variable Lifetime** (the extent of a variable when in a program's execution the variable has a *meaningful* value) of a variable with that object as value (both for static variables and automatic variables). However, in general, object lifetime may not be tied to the lifetime of any one variable
- **Context Java / Python:** In OO languages that use *garbage collection (GC)*, objects are allocated on the heap
 - object lifetime is not determined by the lifetime of a given variable
 - the value of a variable holding an object actually corresponds to a reference to the object, not the object itself, and
 - destruction of the variable just destroys the reference, not the underlying object

Object Lifetime: When is an Object ready? How long can it be used?

Module 13

Module Summary

Application

```
void MyFunc() { // E1: Allocation of c on Stack
    ...
    Complex c; // E2: Constructor called
    ...

    c.norm(); // E5: Use
    ...

    return; // E7: Destructor called
} // E9: De-Allocation of c from Stack
```

Class Code

```
Complex::Complex(double re = 0.0, // Constructor
                 double im = 0.0):
    re_(re), im_(im) // E3: Initialization
{ // E4: Object Lifetime STARTS with initialization
    cout << "Ctor:" << endl;
}
double Complex::norm() // E6 norm executes
{ return sqrt(re_*re_ + im_*im_); }
Complex::~Complex() { cout << "Dtor:" << endl;
} // E8: Object Lifetime ENDS with destructor
```

Event Sequence and Object Lifetime

E1	MyFunc called. Stackframe allocated. c is a part of Stackframe
E2	Control to pass to Complex c . Ctor Complex::Complex(&c) called with the address of c on the frame
E3	Control on Initializer list of Complex::Complex() . Data members initialized (constructed)
E4	Object Lifetime STARTS for c . Control reaches the start of the body of Constructor. Constructor executes
E5	Control at c.norm() . Complex::norm(&c) called. Object is being used
E6	Complex::norm() executes
E7	Control to pass return in MyFunc . Desturctor Complex::~Complex(&c) called
E8	Destructor executes. Control reaches the end of the body of Destructor. Object Lifetime ENDS for c
E9	return executes. Stackframe including c de-allocated. Control returns to caller

Object Lifetime

Module 13

Instructors: Abir
Das and

Dynamic

Module Summary

● Execution Stages

- Memory Allocation and Binding
- Constructor Call and Execution
- Object Use
- Destructor Call and Execution
- Memory De-Allocation and De-Binding

● Object Lifetime

- Starts with execution of Constructor Body
 - ▷ Must *follow* Memory Allocation
 - ▷ As soon as Initialization ends and control enters Constructor Body
- Ends with execution of Destructor Body
 - ▷ As soon as control leaves Destructor Body
 - ▷ Must *precede* Memory De-allocation
- For Objects of *Built-in / Pre-Defined Types*
 - ▷ No Explicit Constructor / Destructor
 - ▷ Lifetime spans from object definition to end of scope

Program 13.15: Complex: Object Lifetime: Automatic

Module Summary

- Objects are initialized by Constructors that can be Parameterized and / or Overloaded
- Default Constructor does not take any parameter – necessary for arrays of objects
- Objects are cleaned-up by Destructors. Destructor for a class is unique
- Compiler provides *free* Default Constructor and Destructor, if not provides by the program
- Objects have a well-defined lifetime spanning from execution of the beginning of the body of a constructor to the execution till the end of the body of the destructor
- Memory for an object must be available before its construction and can be released only after its destruction
