Module Summary

- 1 Multiple Inheritance in C++
 - Semantics
 - Data Members and Object Layout
 - Member Functions – Overrides and Overloads
 - Access Members of Base: protected Access
 - Constructor & Destructor
 - Object Lifetime
- 2 Diamond Problem
 - Exercise
- 3 Design Choice
- 4 Module Summary

Multiple Inheritance in C++: Hierarchy

- TA ISA Student; TA ISA Faculty

```
class Student; // Base Class = Student
class Faculty; // Base Class = Faculty
class TA: public Student, public Faculty; // Derived Class = TA
```

- TA inherits properties and operations of both Student as well as Faculty

Multiple Inheritance in C++: Hierarchy

- **Manager ISA Employee, Director ISA Employee, ManagingDirector ISA Manager, ManagingDirector ISA Director**

```
class Employee; // Base Class = Employee -- Root
class Manager: public Employee; // Derived Class = Manager
class Director: public Employee; // Derived Class = Director
class ManagingDirector: public Manager, public Director; // Derived Class = ManagingDirector
```

- **Manager** inherits properties and operations of **Employee**
- **Director** inherits properties and operations of **Employee**
- **ManagingDirector** inherits properties and operations of both **Manager** as well as **Director**
- **ManagingDirector**, by transitivity, inherits properties and operations of **Employee**
- **Multiple inheritance hierarchy usually has a common base class**
- This is known as the **Diamond Hierarchy**

Multiple Inheritance in C++: Semantics

- Derived ISA Base1, Derived ISA Base2

```
class Base1; // Base Class = Base1
class Base2; // Base Class = Base2
class Derived: public Base1, public Base2; // Derived Class = Derived
```

- Use keyword **public** after class name to denote inheritance
- Name of the Base class follow the keyword
- There may be more than two base classes
- **public** and **private** inheritance may be mixed

Multiple Inheritance in C++: Semantics

- Data Members
 - Derived class *inherits all* data members of *all Base* classes
 - Derived class may *add* data members of its own
- Member Functions
 - Derived class *inherits all* member functions of *all Base* classes
 - Derived class may *override* a member function of *any Base* class by *redefining* it with the *same signature*
 - Derived class may *overload* a member function of *any Base* class by *redefining* it with the *same name*; but *different signature*
- Access Specification
 - Derived class *cannot access private* members of *any Base* class
 - Derived class *can access protected* members of *any Base* class
- Construction-Destruction
 - A *constructor* of the *Derived* class *must first* call *all constructors* of the *Base* classes to construct the *Base* class instances of the *Derived* class – *Base* class *constructors* are called in *listing order*
 - The *destructor* of the *Derived* class *must* call the *destructors* of the *Base* classes to destruct the *Base* class instances of the *Derived* class.

Multiple Inheritance in C++: Data Members and Object Layout

Module 35

Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Multiple
Inheritance in
C++

Semantics

Data Members

Overrides and
Overloads

protected Access

Constructor &
Destructor

Object Lifetime

Diamond
Problem

Exercise

Design Choice

Module Summary

- Data Members
 - Derived class *inherits all* data members of *all Base* classes
 - Derived class may *add* data members of its own
- Object Layout
 - Derived class *layout* contains instances of *each Base* class
 - Further, Derived class *layout* will have data members of its own
 - C++ does not guarantee the *relative position* of the Base class instances and Derived class members

Multiple Inheritance in C++: Data Members and Object Layout

```
class Base1 { protected:  
    int i_, data_;  
public: // ...  
};  
class Base2 { protected:  
    int j_, data_;  
public: // ...  
};  
class Derived: public Base1, public Base2 { // Multiple inheritance  
    int k_;  
public: // ...  
};
```

Object Layout

Object Base1

Object Base2

Object Derived

- Object Derived has two data_ members!
- Ambiguity to be resolved with base class name: `Base1::data_ & Base2::data_`

Multiple Inheritance in C++: Member Functions – Overrides and Overloads

Module 35

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Multiple

protected Access

Constructor &
Destructor

Object Lifetime

Diamond
Problem

Exercise

Design Choice

Module Summary

- **Derived ISA Base1, Base2**
- Member Functions
 - **Derived** class *inherits all* member functions of *all Base* classes
 - **Derived** class may *override* a member function of *any Base* class by *redefining* it with the *same signature*
 - **Derived** class may *overload* a member function of *any Base* class by *redefining* it with the *same name*; but *different signature*
- Static Member Functions
 - **Derived** class *does not inherit* the static member functions of *any Base* class
- Friend Functions
 - **Derived** class *does not inherit* the friend functions of *any Base* class

Multiple Inheritance in C++: Member Functions – Overrides and Overloads

Module 35

Sourangshu
Bhattacharya

Objectives &
Outlines

Multiple
Inheritance in
C++

Semantics

Data Members

Overrides and
Overloads

protected Access

Constructor &
Destructor

Object Lifetime

Diamond
Problem

Exercise

Design Choice

Module Summary

```
class Base1 { protected: int i_, data_;
public: Base1(int a, int b): i_(a), data_(b) { }
    void f(int) { cout << "Base1::f(int) \n"; }
    void g() { cout << "Base1::g() \n"; }
};
class Base2 { protected: int j_, data_;
public: Base2(int a, int b): j_(a), data_(b) { }
    void h(int) { cout << "Base2::h(int) \n"; }
};
class Derived: public Base1, public Base2 { int k_;
public: Derived(int x, int y, int u, int v, int z): Base1(x, y), Base2(u, v), k_(z) { }
    void f(int) { cout << "Derived::f(int) \n"; } // -- Overridden Base1::f(int)
    // -- Inherited Base1::g()
    void h(string) { cout << "Derived::h(string) \n"; } // -- Overloaded Base2:: h(int)
    void e(char) { cout << "Derived::e(char) \n"; } // -- Added Derived::e(char)
};
```

```
Derived c(1, 2, 3, 4, 5);
```

```
c.f(5); // Derived::f(int) -- Overridden Base1::f(int)
c.g(); // Base1::g() -- Inherited Base1::g()
c.h("ppd"); // Derived::h(string) -- Overloaded Base2:: h(int)
c.e('a'); // Derived::e(char) -- Added Derived::e(char)
```

Inheritance in C++:

Member Functions – using for Name Resolution

Ambiguous Calls

```
class Base1 { public:
    Base1(int a, int b);
    void f(int) { cout << "Base1::f(int) "; }
    void g() { cout << "Base1::g() "; }
};
class Base2 { public:
    Base2(int a, int b);
    void f(int) { cout << "Base2::f(int) "; }
    void g(int) { cout << "Base2::g(int) "; }
};
class Derived: public Base1, public Base2 {
public: Derived(int x, int y, int u, int v, int z);
};
Derived c(1, 2, 3, 4, 5);

c.f(5); // Base1::f(int) or Base2::f(int)?
c.g(5); // Base1::g() or Base2::g(int)?
c.f(3); // Base1::f(int) or Base2::f(int)?
c.g(); // Base1::g() or Base2::g(int)?
```

Unambiguous Calls

```
class Base1 { public:
    Base1(int a, int b);
    void f(int) { cout << "Base1::f(int) "; }
    void g() { cout << "Base1::g() "; }
};
class Base2 { public:
    Base2(int a, int b);
    void f(int) { cout << "Base2::f(int) "; }
    void g(int) { cout << "Base2::g(int) "; }
};
class Derived: public Base1, public Base2 {
public: Derived(int x, int y, int u, int v, int z);
    using Base1::f; // Hides Base2::f
    using Base2::g; // Hides Base1::g
};
Derived c(1, 2, 3, 4, 5);

c.f(5); // Base1::f(int)
c.g(5); // Base2::g(int)
c.Base2::f(3); // Base2::f(int)
c.Base1::g(); // Base1::g()
```

- **Overload resolution does not work between `Base1::g()` and `Base2::g(int)`**
- **`using` hides other candidates; Explicit use of base class name can resolve (weak solution)**

Multiple Inheritance in C++:

Access Members of Base: protected Access

- Access Specification

- Derived class *cannot access private* members of *any* Base class
- Derived class *can access protected* members of *any* Base class

protected Access

Constructor &
Destructor

Object Lifetime

Diamond
Problem

Exercise

Design Choice

Module Summary

- Constructor-Destructor
 - Derived class *inherits all* Constructors and Destructor of Base classes (*but in a different semantics*)
 - Derived class *cannot overload* a Constructor or *cannot override* the Destructor of *any* Base class
- Construction-Destruction
 - A *constructor* of the Derived class *must first* call *all constructors* of the Base classes to construct the Base class instances of the Derived class
 - Base class *constructors* are called in *listing order*
 - The *destructor* of the Derived class *must* call the *destructors* of the Base classes to destruct the Base class instances of the Derived class

Multiple Inheritance in C++: Constructor & Destructor

```
class Base1 { protected: int i_; int data_;  
public: Base1(int a, int b): i_(a), data_(b) { cout << "Base1::Base1() "; }  
      ~Base1() { cout << "Base1::~Base1() "; }  
};
```

```
class Base2 { protected: int j_; int data_;  
public: Base2(int a = 0, int b = 0): j_(a), data_(b) { cout << "Base2::Base2() "; }  
      ~Base2() { cout << "Base2::~Base2() "; }  
};
```

```
class Derived: public Base1, public Base2 { int k_;  
public: Derived(int x, int y, int z):  
      Base1(x, y), k_(z) { cout << "Derived::Derived() "; }  
      // Base1::Base1 explicit, Base2::Base2 default  
      ~Derived() { cout << "Derived::~Derived() "; }  
};
```

```
Base1 b1(2, 3);  
Base2 b2(3, 7);  
Derived d(5, 3, 2);
```

Object Layout

Multiple Inheritance in C++: Object Lifetime

```
class Base1 { protected: int i_; int data_;
public: Base1(int a, int b): i_(a), data_(b)
    { cout << "Base1::Base1() " << i_ << ' ' << data_ << endl; }
    ~Base1() { cout << "Base1::~~Base1() " << i_ << ' ' << data_ << endl; }
};

class Base2 { protected: int j_; int data_;
public: Base2(int a = 0, int b = 0): j_(a), data_(b)
    { cout << "Base2::Base2() " << j_ << ' ' << data_ << endl; }
    ~Base2() { cout << "Base2::~~Base2() " << j_ << ' ' << data_ << endl; }
};

class Derived: public Base1, public Base2 { int k_; public:
    Derived(int x, int y, int z): Base1(x, y), k_(z)
    { cout << "Derived::Derived() " << k_ << endl; }
    // Base1::Base1 explicit, Base2::Base2 default
    ~Derived() { cout << "Derived::~~Derived() " << k_ << endl; }
};
```

Derived d(5, 3, 2);

Construction O/P

Base1::Base1(): 5, 3 // Obj. d.Base1

Base2::Base2(): 0, 0 // Obj. d.Base2

Derived::Derived(): 2 // Obj. d

Destruction O/P

Derived::~~Derived(): 2 // Obj. d

Base2::~~Base2(): 0, 0 // Obj. d.Base2

Base1::~~Base1(): 5, 3 // Obj. d.Base1

- First construct base class objects, then derived class object
- First destruct derived class object, then base class objects

Multiple Inheritance in C++: Diamond Problem

- **Student ISA Person**
- **Faculty ISA Person**
- **TA ISA Student; TA ISA Faculty**

```
class Person; // Base Class = Person -- Root
class Student: public Person; // Base / Derived Class = Student
class Faculty: public Person; // Base / Derived Class = Faculty
class TA: public Student, public Faculty; // Derived Class = TA
```

- **Student** inherits properties and operations of **Person**
- **Faculty** inherits properties and operations of **Person**
- **TA** inherits properties and operations of both **Student** as well as **Faculty**
- **TA**, by transitivity, inherits properties and operations of **Person**

Multiple Inheritance in C++: Diamond Problem

Module 35

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Multiple
Inheritance in
C++

Semantics

Data Members

Overrides and
Overloads

protected Access

Constructor &
Destructor

Object Lifetime

Diamond
Problem

Exercise

Design Choice

Module Summary

```
#include<iostream>
using namespace std;

class Person { // data members of person
    public: Person(int x) { cout << "Person::Person(int)" << endl; }
};
class Faculty: public Person { // data members of Faculty
    public: Faculty(int x): Person(x) { cout << "Faculty::Faculty(int)" << endl; }
};
class Student: public Person { // data members of Student
    public: Student(int x): Person(x) { cout << "Student::Student(int)" << endl; }
};
class TA: public Faculty, public Student {
    public: TA(int x): Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
};
int main() { TA ta(30);
}
```

```
Person::Person(int)
Faculty::Faculty(int)
Person::Person(int)
Student::Student(int)
TA::TA(int)
```

- Two instances of base class object (Person) in a TA object!

Multiple Inheritance in C++: virtual Inheritance – virtual Base Class

Module 35

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Multiple
Inheritance in
C++

Semantics

Data Members

Overrides and
Overloads

protected Access

Constructor &
Destructor

Object Lifetime

Diamond
Problem

Exercise

Design Choice

Module Summary

```
#include<iostream>
using namespace std;
class Person { // data members of person
    public: Person(int x) { cout << "Person::Person(int)" << endl; }
    Person() { cout << "Person::Person()" << endl; } // Default ctor for virtual inheritance
};
class Faculty: virtual public Person { // data members of Faculty
    public: Faculty(int x): Person(x) { cout << "Faculty::Faculty(int)" << endl; }
};
class Student: virtual public Person { // data members of Student
    public: Student(int x): Person(x) { cout << "Student::Student(int)" << endl; }
};
class TA: public Faculty, public Student {
    public: TA(int x): Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
};
int main() { TA ta(30); }
```

```
Person::Person()
Faculty::Faculty(int)
Student::Student(int)
TA::TA(int)
```

- Introduce a default constructor for root base class **Person**
- Prefix every inheritance of **Person** with **virtual**
- **Only one instance of base class object (Person) in a TA object!**

Multiple Inheritance in C++: virtual Inheritance with Parameterized Ctor

Module 35

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Multiple
Inheritance in
C++

Semantics

Data Members

Overrides and
Overloads

protected Access

Constructor &
Destructor

Object Lifetime

Diamond
Problem

Exercise

Design Choice

Module Summary

```
#include<iostream>
using namespace std;

class Person {
    public: Person(int x) { cout << "Person::Person(int)" << endl; }
    Person() { cout << "Person::Person()" << endl; }
};

class Faculty: virtual public Person {
    public: Faculty(int x): Person(x) { cout << "Faculty::Faculty(int)" << endl; }
};

class Student: virtual public Person {
    public: Student(int x): Person(x) { cout << "Student::Student(int)" << endl; }
};

class TA: public Faculty, public Student {
    public: TA(int x): Student(x), Faculty(x), Person(x) { cout << "TA::TA(int)" << endl; }
};

int main() { TA ta(30); }

Person::Person(int)
Faculty::Faculty(int)
Student::Student(int)
TA::TA(int )
```

- Call parameterized constructor of root base class `Person` from constructor of `TA` class

Multiple Inheritance in C++: Ambiguity

```
#include<iostream>
using namespace std;

class Person {
    public: Person(int x) { cout << "Person::Person(int)" << endl; }
    Person() { cout << "Person::Person()" << endl; }
    virtual ~Person();
    virtual void teach() = 0;
};

class Faculty: virtual public Person {
    public: Faculty(int x): Person(x) { cout << "Faculty::Faculty(int)" << endl; }
    virtual void teach();
};

class Student: virtual public Person {
    public: Student(int x): Person(x) { cout << "Student::Student(int)" << endl; }
    virtual void teach();
};

class TA: public Faculty, public Student {
    public: TA(int x):Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
    virtual void teach();
};
```

- In the absence of `TA::teach()`, which of `Student::teach()` or `Faculty::teach()` should be inherited?

Multiple Inheritance in C++: Exercise

Module 35

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Multiple
Inheritance in
C++

Semantics

Data Members

Overrides and
Overloads

protected Access

Constructor &
Destructor

Object Lifetime

Diamond
Problem

Exercise

Design Choice

Module Summary

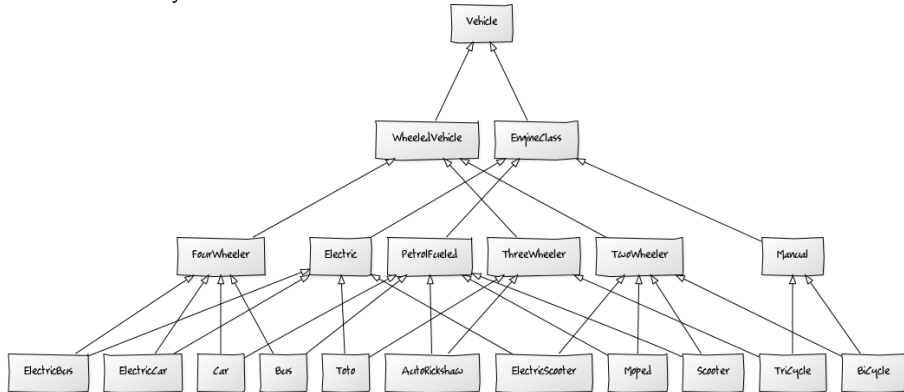

```
class A {  
public:  
    virtual ~A() { cout << "A::~A()" << endl; }  
    virtual void foo() { cout << "A::foo()" << endl; }  
};  
class B: public virtual A {  
public:  
    virtual ~B() { cout << "B::~B()" << endl; }  
    virtual void foo() { cout << "B::foo()" << endl; }  
};  
class C: public virtual A {  
public:  
    virtual ~C() { cout << "C::~C()" << endl; }  
    virtual void foobar() { cout << "C::foobar()" << endl; }  
};  
class D: public B, public C {  
public:  
    virtual ~D() { cout << "D::~D()" << endl; }  
    virtual void foo() { cout << "D::foo()" << endl; }  
    virtual void foobar() { cout << "D::foobar()" << endl; }  
};
```

- Consider the effect of calling `foo` and `foobar` for various objects and various pointers

Design Choice: Inheritance or Composition

- **Vehicle** Hierarchy

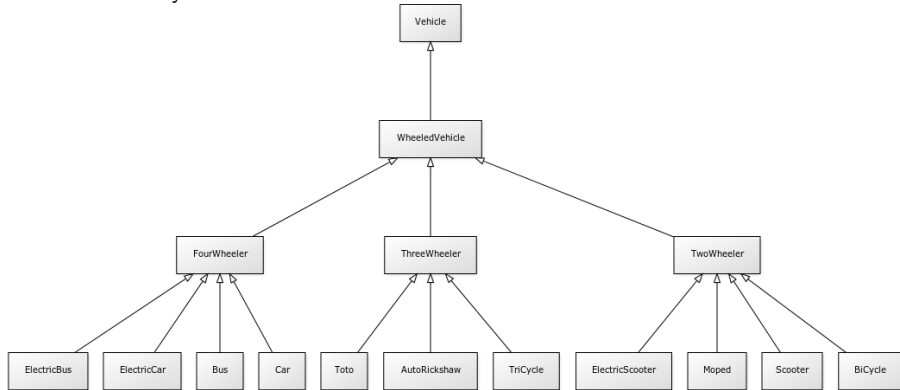

- **Wheeled** Hierarchy and **Engine** Hierarchy interact
- Large number of cross links!
- Multiplicative options make modeling difficult

Design Choice: Inheritance or Composition

- **Vehicle Hierarchy**

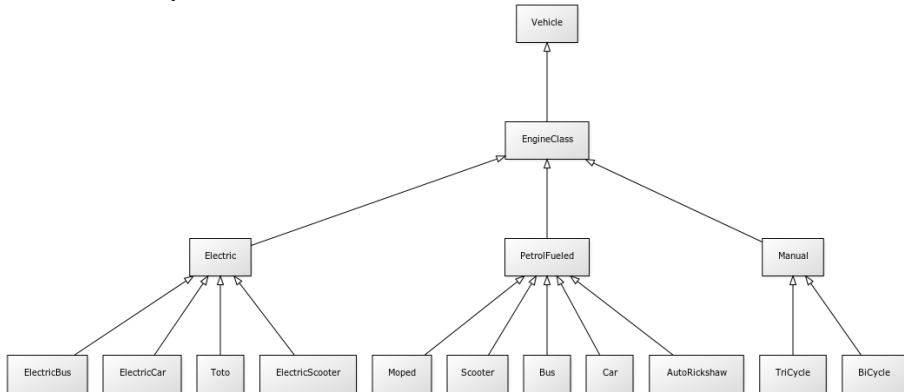

- **Wheeled** Hierarchy use **Engine** as Component
- Linear options to simplify models
- Is this dominant?

Design Choice: Inheritance or Composition

- **Vehicle Hierarchy**

- **Engine Hierarchy** use **Wheeled** as Component
- Linear options to simplify models
- Is this dominant?
